Vector

सुनो भाई ये chapter वैसे तो mathematics का है जो maths वाले बच्चे 12th class में extreme detail में पढ़ेंगे यहाँ हमें उतना ही पढ़ना है जितना physics में use होना है जरूरत से ज्यादा PHD करने की कोशिश ना करें bcz वो हम 12th में करेंगे कुछ बच्चे जो इसे पहली बार पढ़ रहे हैं उन्हें

starting में यह chapter मुश्किल लग सकता है उनसे मैं यही कहूँगा की जितना content मैं यहाँ दे रहा हूँ उसको 3-4 बार अच्छे से rough copy पर practice कर ले इतने से physics में अच्छे से काम चल जाएगा।

Scalar Quantity

Those physical quantities which can be completely described by its magnitude only are called Scalar.

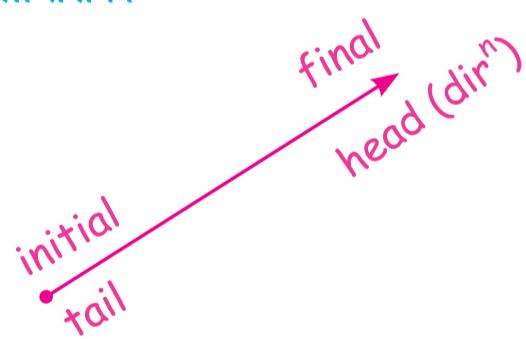

Vector Quantity

Those physical quantity which have magnitude & direction and they follow law of vector algebra.

Eg. Force, Acceleration, Momentum.

REPRESENTATION OF VECTOR

Diagram वाला तरीका

Length of arrow represent magnitude of vector.

SKC

कौन सी Physical quantity vector हैया scalar है अभी हमें इस बात से कोई लेना देना नहीं है। क्योंकि अभी हमारी physics start नहीं हुई है so take it lightly Vector का सुरु होले होले चढ़ेगा।

Mathematically/Analytical

★ A vector P is represented by \vec{P}

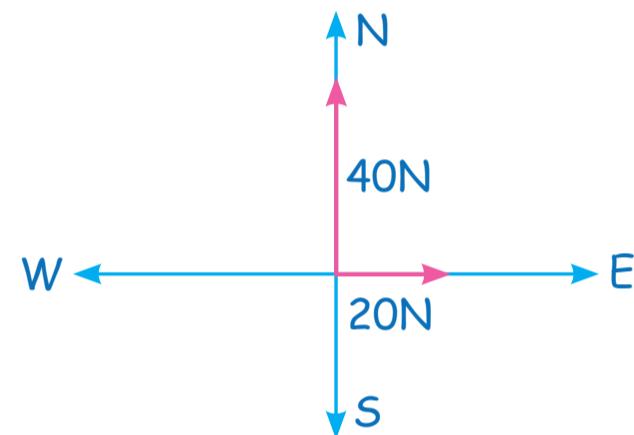

★ Force = \vec{F}

Q. Represent vector \vec{P} & vector \vec{Q}

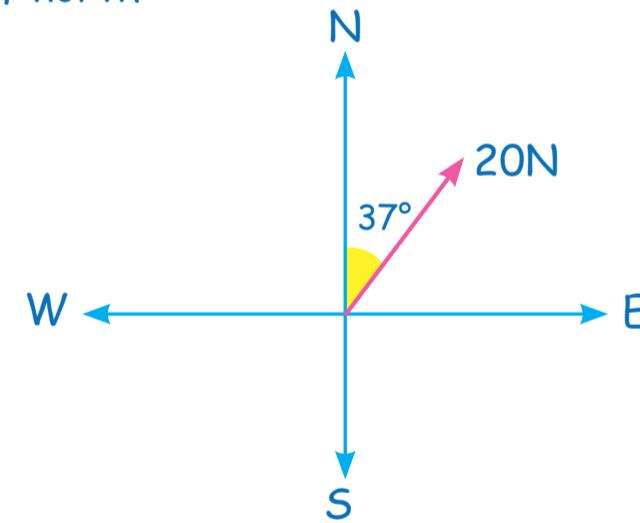

$\vec{P} = 20\text{N}$ along East

$\vec{Q} = 40\text{N}$ along north

Sol.

★ Represent \vec{P} of magnitude 20N in direction of 37° east of north

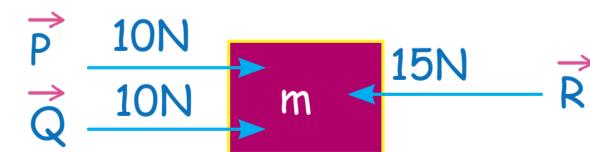

TYPES OF VECTOR

अब अच्छे से इनकी reading ले लेना।

Equal Vector

Two vector are said to be equal vector, if they have same magnitude, same direction and same physical quantity.

\vec{R} and \vec{P} are equal vector : X

\vec{P} and \vec{Q} are equal vector : ✓

Parallel Vector →

Two vectors are said to be parallel if they have same direction.

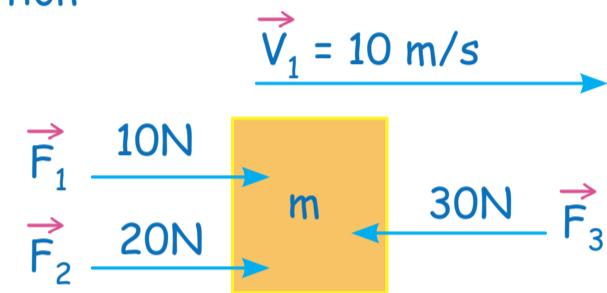

Here, Physical quantity,

अलग - अलग हो सकती है।

All equal vectors are parallel vectors

Anti-Parallel Vector = Direction Opposite

A Block is moving with constant velocity 10 m/s along east direction

\vec{F}_1 & \vec{F}_2 are parallel vector.

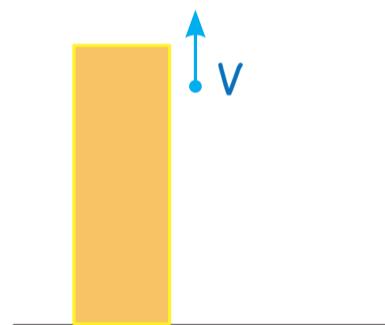

\vec{F}_1 & \vec{F}_2 are not equal vector.

\vec{F}_1 & \vec{V}_1 are parallel vector

\vec{F}_2 & \vec{V}_1 are parallel vector

\vec{F}_1 & \vec{F}_3 are anti-parallel vector

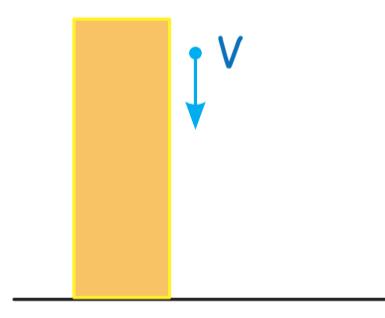

\vec{V}_1 & \vec{F}_3 are anti-parallel vector.

$\vec{V} \rightarrow$ ऊपर

$\vec{a} \rightarrow$ नीचे

\vec{V}, \vec{a} are antiparallel.

$\vec{V} \rightarrow$ नीचे

$\vec{a} \rightarrow$ नीचे

\vec{V}, \vec{a} are parallel.

Negative Vector

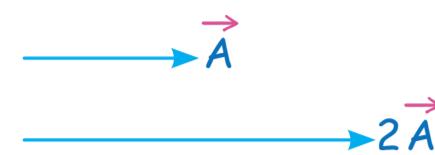

Two vectors \vec{A} , & \vec{B} , are said to be negative of each other if they have same magnitude & opposite direction.

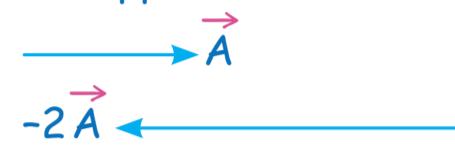

$\vec{A} = -\vec{B}$ are negative vector to each other.

Multiplication of a Vector with a Number

★ If a vector \vec{A} is multiply by a number $n > 0$. Then magnitude of vector becomes n times & direction remains same.

★ If a vector \vec{A} is multiply by a number $n < 0$, then magnitude of vector becomes n times & direction become opposite.

SKC

अगर हमने किसी vector को n से Multiply किया तो vector की length n times हो जाएगी / अगर n +ve है तो direction same रहेगी और अगर n -ve है तो direction opposite हो जाएगी।

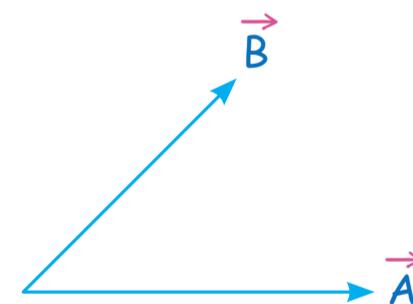

Coplanar Vector

If all vectors lie in same plane then vectors are known as co-planar.

NOTE:- TWO VECTORS are always COPLANAR

Coinitial Vector

[Tail to Tail]: Two vectors are said to be coinitial if they have same initial point.

Co-Initial vector

Collinear vector

Parallel vector

Orthogonal vector

कौन-सी physical quantity scalar है कौन-सी vector है ये तू याद कर रहा है ?????

Haa humne RATT liye

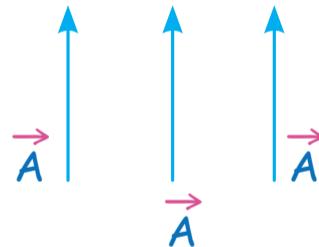

Nhi RATTNA tha

पूरे दो साल यही पढ़ना है कि कौन-सी physical quantity क्या है So, इस पर time बिलकुल waste ना करें और मस्त रहे।

Parallel Shifting of Vector

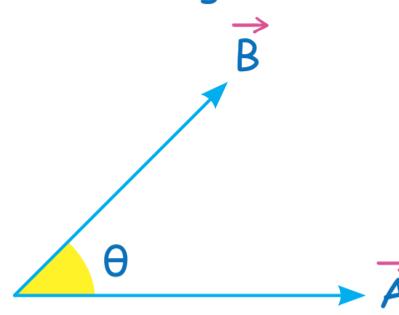

Whenever we need, we can parallelly shift any vector without changing direction and magnitude we can say that vector will not change.

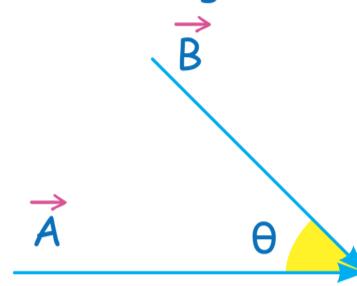

- ◆ देख भाई अभी हम अपनी जरूरत के अनुसार vector को parallelly shift कर सकते हैं जैसे computer के mouse का cursor sign होता है।
- ◆ अगर किसी vector की dirxn बदली मतलब vector बदल जाएगा।
- ◆ अगर किसी vector का Magnitude बदला मतलब vector बदला जाएगा।
- ◆ अगर Magnitude, direction same = vector same

Angle Between Two Vectors

★ It is the angle b/w their tail.

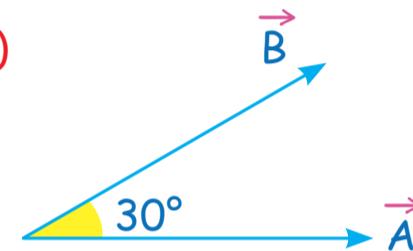

★ It is the angle b/w their head.

$[0 < \theta < 180]$ $[\theta \rightarrow \text{angle b/w } \vec{A} \text{ & } \vec{B}]$

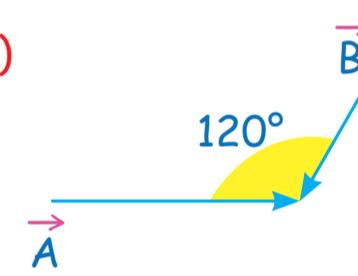

Q. Find angle b/w \vec{A} & \vec{B}

(a)

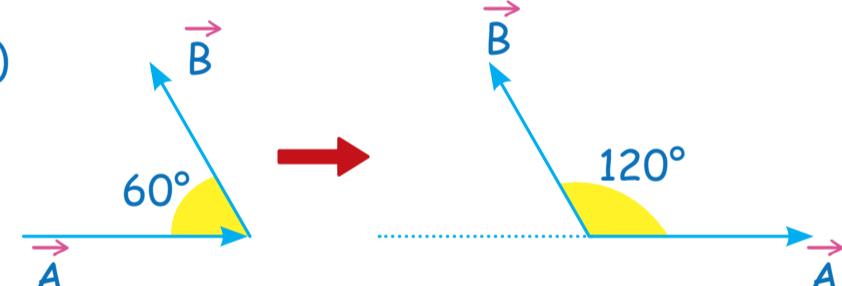

Angle b/w vectors = 30°

(b)

Angle b/w vectors = 120°

(c)

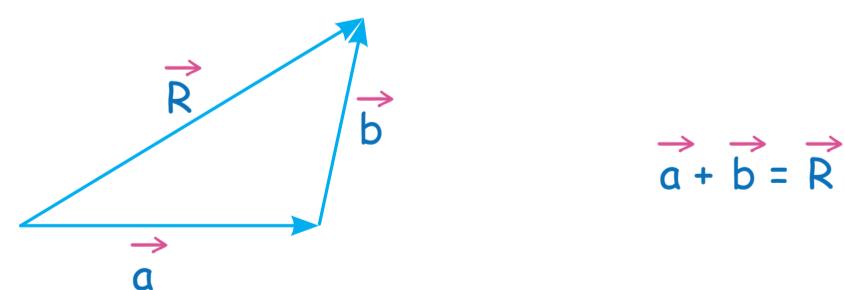

Angle b/w vectors = $180 - 60^\circ = 120^\circ$

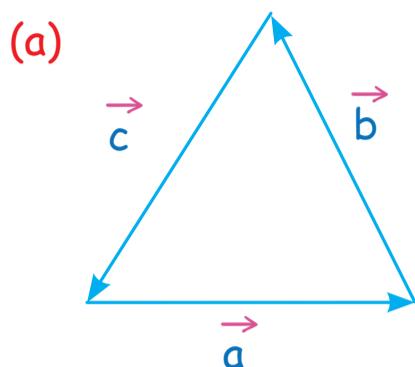

ADDITION OF 2 VECTORS

Triangle Rule of Vector Addition

If 2 vectors represent two sides of a triangle in same sense (head of first vector coincide with tail of other vector) resultant is 3rd side of triangle in opposite sense.

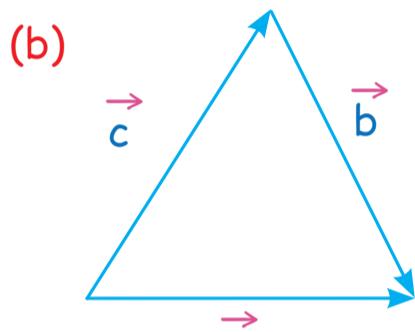

Q. Write the eqn for following fig. using triangle of vector addition.

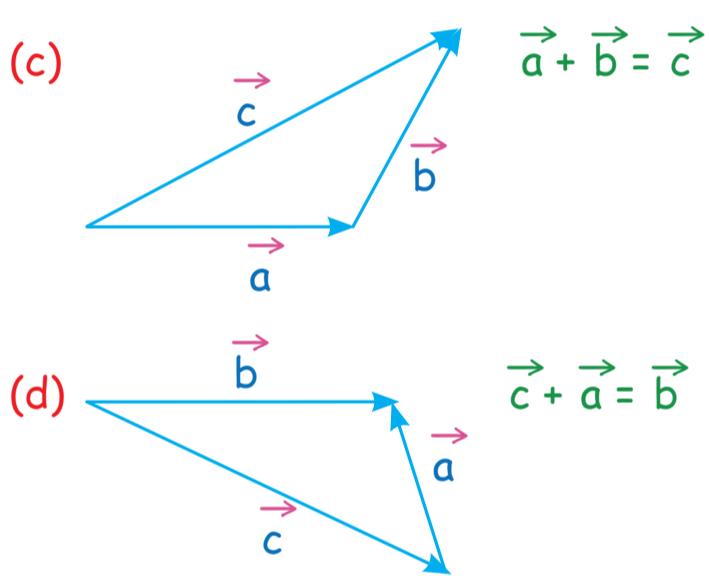

Closed loop same sense

$\vec{a} + \vec{c} + \vec{b} = 0$ इसका मतलब तीनों vector का sum/addition/resultant 0 आया।

$$\vec{a} = \vec{b} + \vec{c} \Rightarrow \vec{a} - \vec{c} = \vec{b}$$

\vec{a} is resultant of \vec{c} and \vec{b}

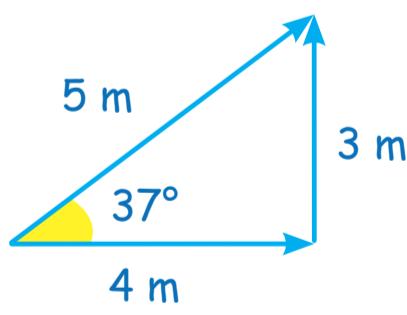

$$\vec{a} + \vec{b} = \vec{c}$$

$$\vec{c} + \vec{a} = \vec{b}$$

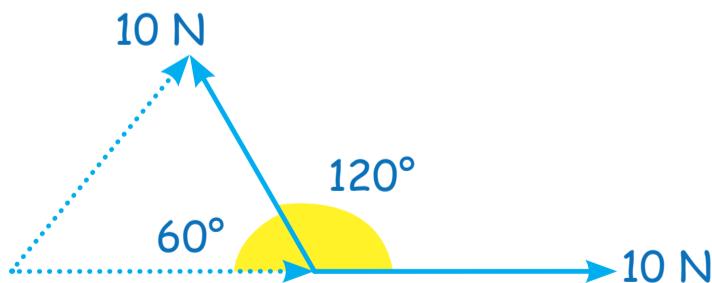

Q. A man moves 4m in east direction and then 3m in north direction. Find the resultant displacement of man.

Sol.

5 m in 37° north of east OR 5 m in 53° East of north.

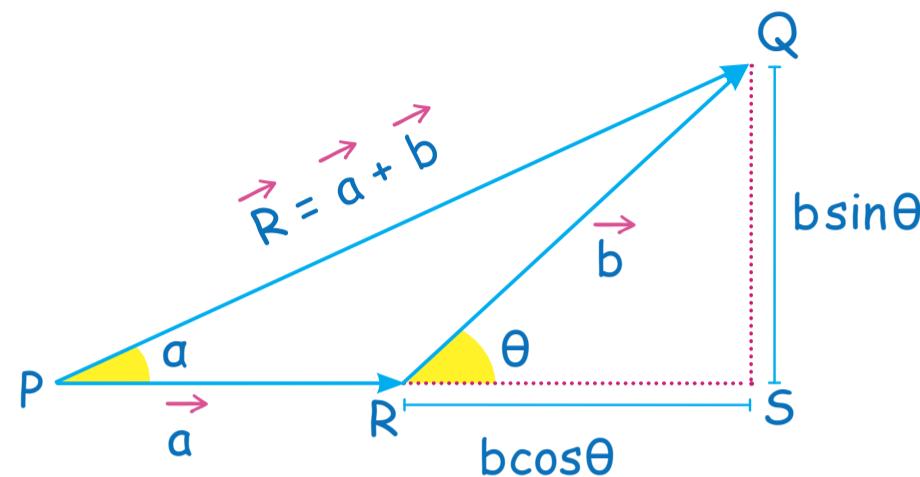

Q.

Sol. Resultant 10 in 60° north of east.

24

ANALYTICAL METHOD TO FIND RESULTANT AND ITS DIRECTION (OF 2 VECTORS)

$$|\vec{a}| = a, |\vec{b}| = b, |\vec{R}| = |\vec{a} + \vec{b}| = R$$

In $\triangle RQS$

$$\sin \theta = QS/b \Rightarrow QS = b \sin \theta$$

$$\cos \theta = RS/b \Rightarrow RS = b \cos \theta$$

In $\triangle PQS$

$$(PQ)^2 = (PR + RS)^2 + QS^2$$

$$R^2 = (a + b \cos \theta)^2 + (b \sin \theta)^2$$

$$R^2 = a^2 + b^2 (\cos^2 \theta + \sin^2 \theta)^2 + 2ab \cos \theta$$

$$R = \sqrt{a^2 + b^2 + 2ab \cos \theta}$$

$$\tan \alpha = \frac{b \sin \theta}{a + b \cos \theta}$$

R = Magnitude of resultant.

α = Angle b/w \vec{R} & \vec{a}

देख भाई काम की बात यह है कि दो vector \vec{a} and \vec{b} के resultant का magnitude $R = \sqrt{a^2 + b^2 + 2ab \cos \theta}$ होता है जो \vec{a} के साथ angle α बनाता है

Where $\tan \alpha = \frac{b \sin \theta}{a + b \cos \theta}$ ये formula

गलती से भी मत भूलना वरना पिटाई होगी अगर resultant R ने \vec{b} के साथ angle β बनाया

तो $\tan \beta = \frac{a \sin \theta}{b + a \cos \theta}$

Q. Two vector of magnitude 10N each gives a resultant of magnitude $10\sqrt{3}$ N. Find angle b/w both vector.

Sol. $R = 10\sqrt{3}$ N

$$R = \sqrt{10^2 + 10^2 + 200 \cos \theta}$$

$$300 = 200 + 200 \cos \theta \Rightarrow \theta = 60^\circ$$

Q. Two forces \vec{A} and \vec{B} of magnitude 10 N and 20 N are acting on a block having 60° angle between them. Find the magnitude of resultant of them

Sol. $R = \sqrt{A^2 + B^2 + 2AB \cos \theta}$

$$= \sqrt{100 + 400 + 200} = \sqrt{700}$$

Angle made by resultant of \vec{A} & \vec{B} with \vec{A} .

$$\tan \alpha = \frac{B \sin \theta}{A + B \cos \theta} = \frac{20 \times \frac{\sqrt{3}}{2}}{10 + 20 \times \frac{1}{2}} = \frac{\sqrt{3}}{2}$$

SPECIAL CASES

1 $\theta = 0^\circ$ (Parallel Vectors)

$$\vec{R} = \vec{a} + \vec{b}$$

$$R = \sqrt{a^2 + b^2 + 2ab} = a + b$$

$$R_{\max} = a + b = |\vec{a}| + |\vec{b}|$$

2 $\theta = 180^\circ$ (Antiparallel Vectors)

$$\vec{R} = \vec{a} + \vec{b}$$

$$R = \sqrt{a^2 + b^2 - 2ab} = |a - b|$$

$$R_{\min} = |a - b| = ||\vec{a}| - |\vec{b}||$$

$$|a - b| \leq R \leq (a + b)$$

$$R_{\max} = a + b \quad R_{\min} = |a - b|$$

3 $\theta = \pi/2$ or 90°

$$R = \sqrt{a^2 + b^2}$$

NOTE: Value of θ increases from 0° to 180° then magnitude of resultant will decrease.

Vector की understanding

बढ़ाने के लिए नीचे कुछ important ques. attach कर रहा हूँ भले ही आपको कुछ ques. easy लगे फिर भी आपको सारे ques. in the last solve करने हैं।

Thik hai Bhai

Q. Max and min magnitude of resultant of two forces are 7 N and 1 N respectively. Find the resultant of 2 forces when it act orthogonally.

Sol. $F_1 + F_2 = 7$ N;

$$F_1 - F_2 = 1$$
 N

$$\Rightarrow F_1 = 4$$
 N; $F_2 = 3$ N

When F_1 and F_2 are perpendicular to each other

$$\text{then } R = \sqrt{3^2 + 4^2} = 5$$

Q. Two vector A & B with same magnitude x . Find magnitude of resultant of A and B . $\theta = 60^\circ$.

Sol. $R = \sqrt{A^2 + B^2 + 2AB \cos \theta}$

$$= \sqrt{2x^2 + 2x^2 \cos 60^\circ}$$

$$= \sqrt{2x^2 + 2x^2 \frac{1}{2}} = \sqrt{3x^2} = x\sqrt{3}$$

Q. In above question if $A = x$, $B = x$, $\theta = 120^\circ$, $R = ?$

Sol. $R = \sqrt{A^2 + B^2 + 2AB \cos \theta}$

$$= \sqrt{2x^2 + 2x^2 \left(-\frac{1}{2}\right)}$$

$$= \sqrt{x^2} = x$$

Q. If two vector \vec{A} and \vec{B} of magnitude 10 N and 6 N are at an angle 60° . If \vec{B} become twice to its initial value & added to \vec{A} . Find magnitude of resultant of A & B after \vec{B} change.

Sol. $B = 2 \times 6 = 12$ N

$$A = 10$$
 N

अब θ तो 60°
ही रहेगा

$$C = \sqrt{100 + 144 + 2 \times 10 \times 12 \times \cos 60^\circ} = \sqrt{364}$$

Q. Magnitude of \vec{A} is 8 N.

Magnitude of \vec{B} is 6 N.

Which of the following can be magnitude of $\vec{A} + \vec{B}$

- (a) 10 N (b) 22 N (c) 48 N
 (d) 2 N (e) 2.001 N (f) 1.99 N
 (g) 14.1 N (h) 13.999 N

Sol. $C_{\max} = A + B = 14$

$C_{\min} = A - B = 2$

$2 \leq C \leq 14$

Ans. (a), (d), (e), (h)

Q. Magnitude of resultant of \vec{A} and \vec{B} is 5 unit where magnitude of \vec{A} is $5\sqrt{3}$ unit and magnitude of $\vec{B} = 5$ unit. Find angle between A and B .

Sol. $\vec{C} = \sqrt{A^2 + B^2 + 2AB\cos\theta}$

$5^2 = 75 + 25 + 50\sqrt{3}\cos\theta$

$\frac{-\sqrt{3}}{2} = \cos\theta \Rightarrow \theta = 150^\circ$

Q. Sum of the magnitude of \vec{A} and \vec{B} is 16 N. Magnitude of resultant of vector \vec{A} and \vec{B} is 8 N. When resultant is perpendicular to the \vec{A} . Find magnitude of \vec{A} and \vec{B} .

Sol. $A + B = 16$ N

Magnitude of $\vec{R} = 8$ N

$\alpha = 90^\circ$

$$R = \sqrt{A^2 + B^2 + 2AB\cos\theta}, \tan\alpha = \frac{B\sin\theta}{A + B\cos\theta}$$

$$\tan 90^\circ = \frac{B\sin\theta}{A + B\cos\theta} \Rightarrow A + B\cos\theta = 0$$

$B\cos\theta = -A$

$64 = A^2 + B^2 + 2AB\cos\theta$

$64 = A^2 + B^2 - 2A^2$

$64 = B^2 - A^2 = (A + B)(B - A)$

$64 = 16(B - A)$

$4 = (B - A)$

$B - A = 4$

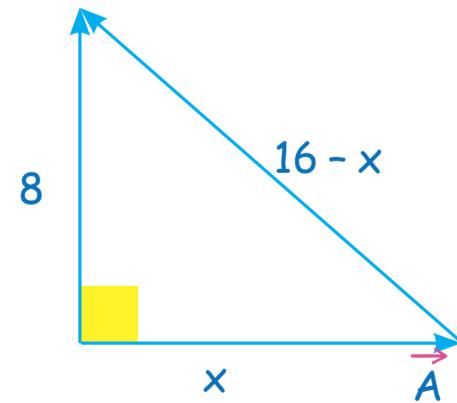

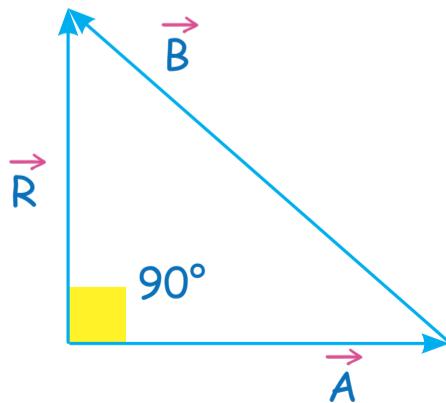

$B + A = 16$

$2B = 20$

$B = 10$

$A = 6$

Method-2:

By using Pythagoras theorem.

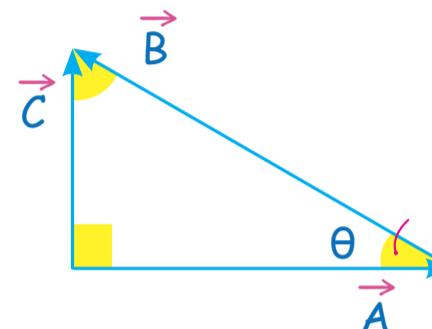

$$(16 - x)^2 = 8^2 + x^2$$

$$256 + x^2 - 32x = 64 + x^2$$

$$256 - 32x = 64$$

$$\Rightarrow 6 = x \quad \& \quad 16 - x = 10$$

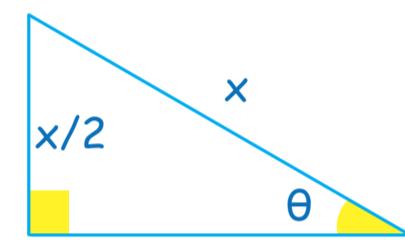

Q. Resultant of \vec{A} and \vec{B} is \perp to \vec{A} and its magnitude is equal to half of magnitude of \vec{B} . Find the angle between \vec{A} and \vec{B} .

Sol. $\vec{A} + \vec{B} = \vec{C}$

$$\sin\theta = \frac{x}{x} = \frac{1}{2}$$

$\theta = 30^\circ$

Angle between \vec{A} & $\vec{B} = 180^\circ - 30^\circ = 150^\circ$

Angle between \vec{B} and $\vec{C} = 60^\circ$

Angle between \vec{A} and $\vec{C} = 90^\circ$

3. Two vector \vec{A} and \vec{B} have same magnitude 'a' and resultant has magnitude R. Now \vec{B} is doubled and added to \vec{A} and now new resultant become $a\sqrt{3}$. Find angle b/w \vec{A} and \vec{B} .

Sol. $\vec{A} + \vec{B} = \vec{R}$

$$R = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

$$R_{\text{old}} = \sqrt{2a^2 + 2a^2\cos\theta}$$

$$|2\vec{B} + \vec{A}| = a\sqrt{3}$$

$$R_{\text{new}} = \sqrt{a^2 + (2a)^2 + 2(a)(2a)\cos\theta}$$

$$a\sqrt{3} = \sqrt{a^2 + 4a^2 + 4a^2\cos\theta}$$

$$3a^2 = 5a^2 + 4a^2\cos\theta$$

$$-2a^2 = 4a^2\cos\theta$$

$$\frac{-2}{4} = \frac{-1}{2} = \cos\theta$$

$\theta = 120^\circ$

काम का डब्बा

★ If $\vec{A} + \vec{B} = \vec{R}$

$$\text{Magnitude of } \vec{R} = R = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

θ = angle between A & B

$$★ \tan\alpha = \frac{b\sin\theta}{a+b\cos\theta} \quad (\text{कैसे आया Not Important})$$

(α is the angle made by \vec{R} with \vec{A})

★ $R = |\vec{A} + \vec{B}|$ = magnitude of resultant of \vec{A} and \vec{B} .

$$★ |A - B| \leq R \leq (A + B)$$

★ दो vector का Resultant max तब होगा जब उनके बीच angle 0° होगा। और Min तब होगा जब उनके बीच angle 180° होगा।

$$\text{If } \theta = 0 \Rightarrow R = A + B = R_{\max}$$

$$\text{If } \theta = 180 \Rightarrow R = |A - B| = R_{\min} = [\text{बड़ा-छोटा}]$$

$$\text{If } \theta = 90 \Rightarrow R = \sqrt{A^2 + B^2}$$

$$★ \text{If } |\vec{A}| = |\vec{B}| = A \text{ (let)}$$

$$\theta = 0 \rightarrow R = 2A$$

$$\theta = 60^\circ \rightarrow R = A\sqrt{3}$$

$$\theta = 90^\circ \rightarrow R = A\sqrt{2}$$

$$\theta = 120^\circ \rightarrow R = A$$

$$\theta = 180^\circ \rightarrow R = 0$$

$$R = 2A \cos \theta/2$$

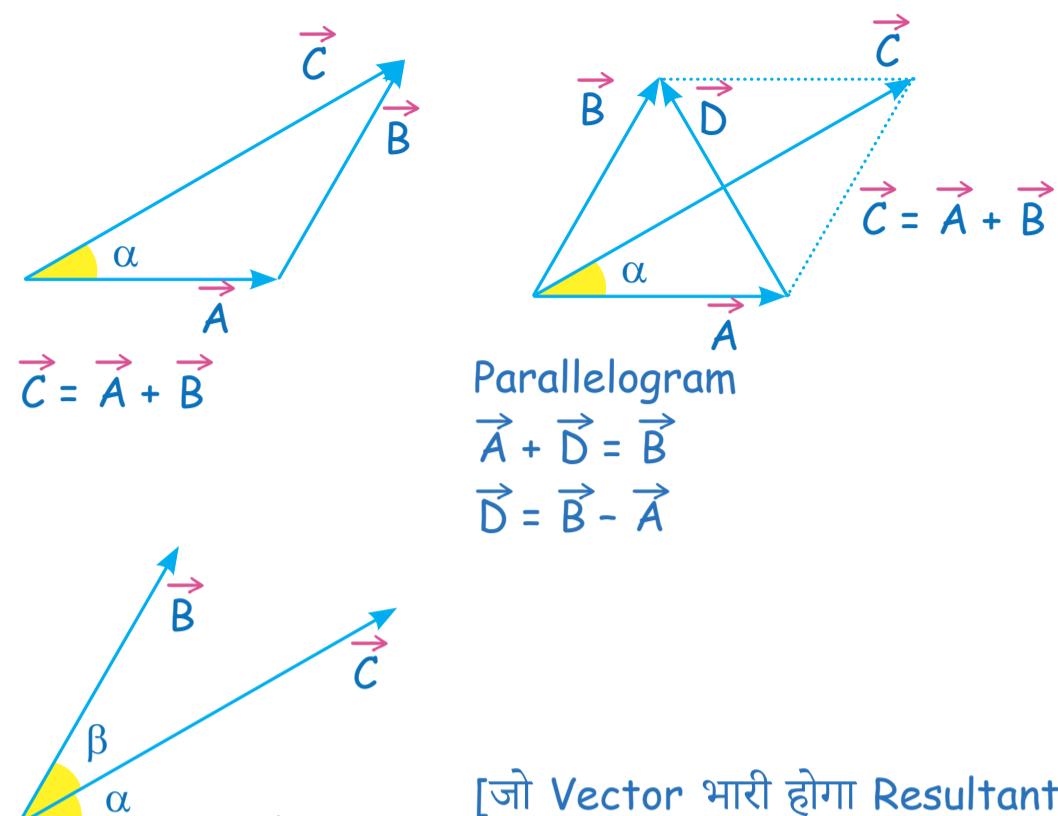

दो equal magnitude के vector अगर 60° पर हैं तो उनका resultant $\sqrt{3}$ times i.e $A\sqrt{3}$ होगा और वो 120° पर हैं तो उनका resultant A होगा।

★ दो equal magnitude वाले vector का resultant उनके बीचो-बीच (along angle bi-sector) निकलेगा।

C PARALLELOGRAM LAW OF VECTOR ADDITION

If two coinitial vectors are given then resultant of these two vectors are given by diagonal of parallelogram (II gm) made from 2 given vector by shifting them parallel to their coinitial vector & other diagonal of the II gm gives difference of vectors.

Vector

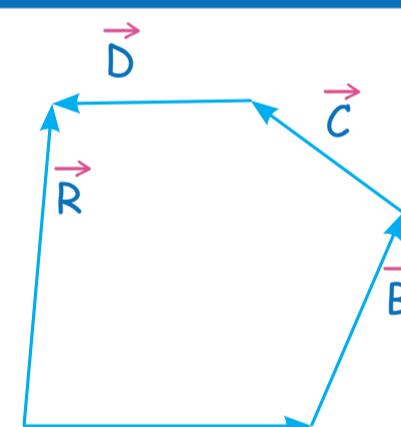

[जो Vector भारी होगा Resultant उस तरफ झुकेगा]

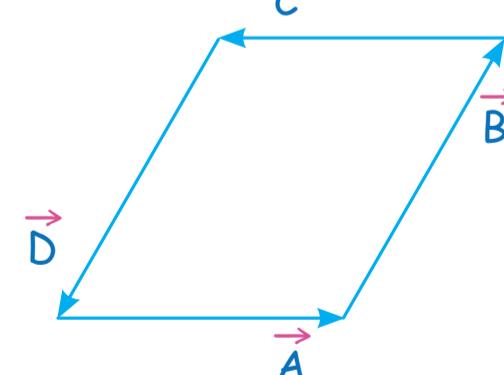

POLYGON-LAW

SKC

Resultant vector को draw करने के लिए पहले की Tail को Last के Head se Join Krdo

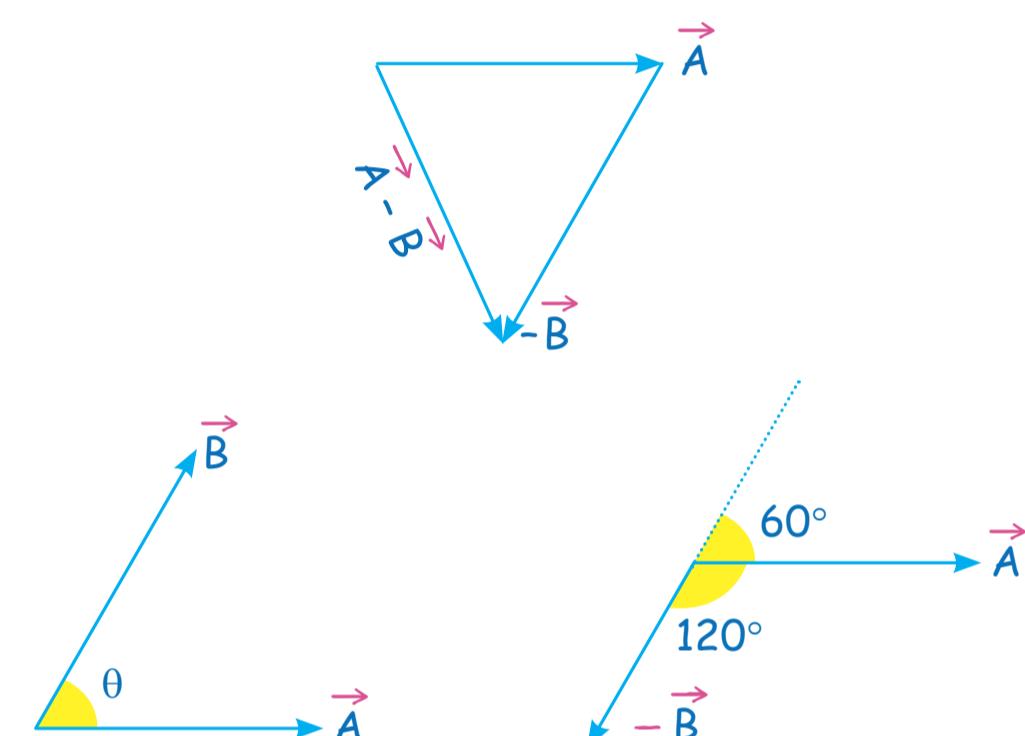

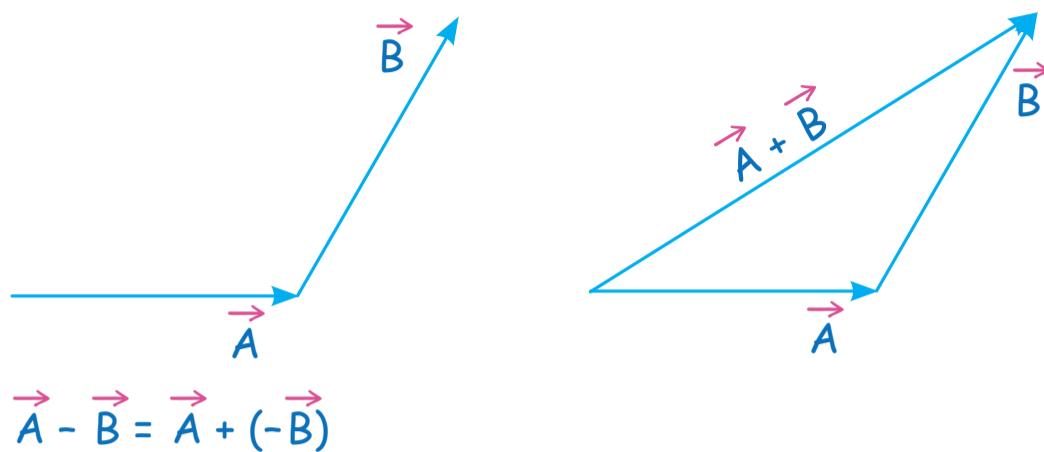

$$\vec{A} + \vec{B} + \vec{C} + \vec{D} = \vec{R}$$

$$\vec{A} + \vec{B} + \vec{C} + \vec{D} = \vec{O}$$

[zero vector]
Dirxn of this zero vector is arbitrary. [Jo Man Kre]
It is a vector where magnitude is zero.

SUBTRACTION OF TWO VECTOR

\vec{A} और \vec{B} के बीच angle θ है तो \vec{A} में और $-\vec{B}$ के बीच $180-\theta$ angle होगा।

If angle between \vec{A} & \vec{B} is θ ,

Then, $\vec{C} = \vec{A} + \vec{B}$

$$C = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

$$\tan\alpha = \frac{B\sin\theta}{A + B\cos\theta}$$

SKC

पूरी Physics में किसी vector की Physical quantity में (-) sign का मतलब ये होगा की जिधर आपने + ve dirxⁿ मानी है। उसके opposite physical quantity की dirxⁿ है।
[(-) मतलब dirxⁿ से लेना देना]

$$\& \vec{D} = \vec{A} - \vec{B} = \vec{A} + (-\vec{B})$$

↳ Magnitude = ?

angle between \vec{A} & $-\vec{B}$ will be $180 - \theta$.

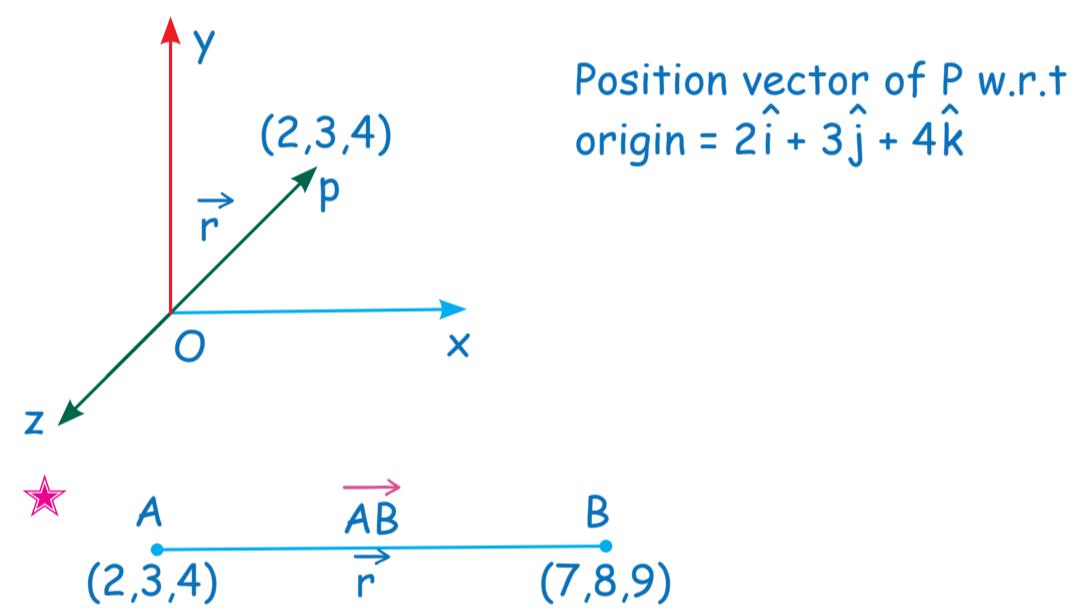

$$D = \sqrt{A^2 + B^2 + 2AB\cos(180 - \theta)}$$

$$= \sqrt{A^2 + B^2 - 2AB\cos\theta}$$

$$\tan\alpha = \frac{B\sin(180 - \theta)}{A + B\cos(180 - \theta)} = \frac{B\sin\theta}{A - B\cos\theta}$$

POSITION VECTOR

A vector representing location or position of a point in space w.r.t origin is called position vector.

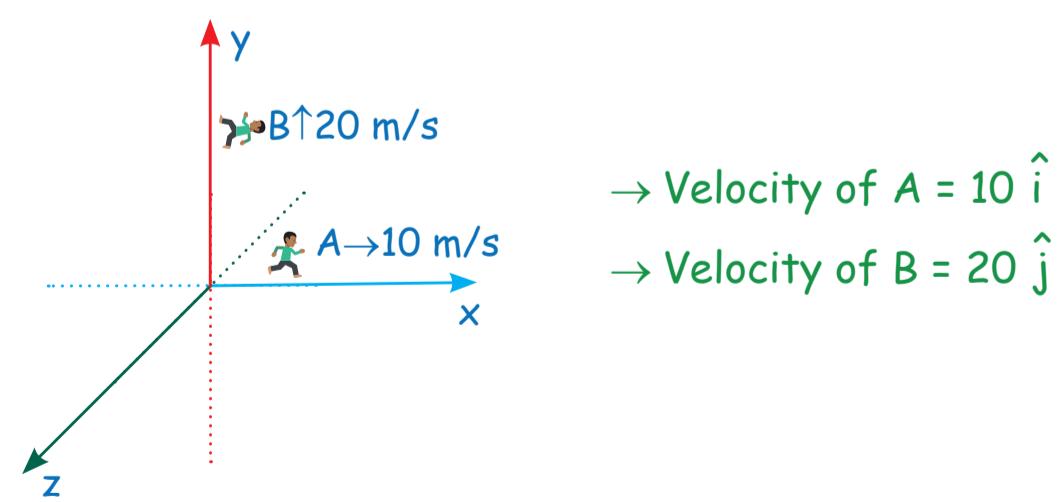

$$\vec{AB} = \text{P.V of } B - \text{P.V of } A$$

$$= (7-2)\hat{i} + (8-3)\hat{j} + (9-4)\hat{k} = 5\hat{i} + 5\hat{j} + 5\hat{k}$$

Q. A particle A is moving with speed 10 m/s along + x-axis and another particle B is moving along y-axis with speed 20 m/s. Find their velocity.

Sol.

$$\rightarrow \text{Velocity of } A = 10\hat{i}$$

$$\rightarrow \text{Velocity of } B = 20\hat{j}$$

MAGNITUDE OF A VECTOR

Q. $\vec{A} = A_x \hat{i} + A_y \hat{j} + A_z \hat{k}$

Sol. Magnitude of $A = \sqrt{A_x^2 + A_y^2 + A_z^2}$

Q. $\vec{A} = 2\hat{i} + 3\hat{j} + 4\hat{k}, |\vec{A}| = ?$

Sol. Magnitude of A

$$= \sqrt{2^2 + 3^2 + 4^2} = \sqrt{4 + 9 + 16} = \sqrt{29}$$

Q. $\vec{A} = 2\hat{i} + 3\hat{j} - 4\hat{k}, |\vec{A}| = ?$

Sol. Magnitude of A

$$= \sqrt{2^2 + 3^2 + (-4)^2} = \sqrt{2^2 + 3^2 + 4^2} = \sqrt{29}$$

Q. $\vec{A} = \frac{1}{\sqrt{2}} \hat{i} + \frac{1}{\sqrt{2}} \hat{j}$. Find magnitude of \vec{A} .

Sol. $|\vec{A}| = \sqrt{\left(\frac{1}{\sqrt{2}}\right)^2 + \left(\frac{1}{\sqrt{2}}\right)^2} = 1$

Q. $\vec{A} = \frac{1}{\sqrt{3}} \hat{i} + \frac{1}{\sqrt{3}} \hat{j} + \frac{1}{\sqrt{3}} \hat{k}, |\vec{A}| = ?$

Sol. $|\vec{A}| = \sqrt{\left(\frac{1}{\sqrt{3}}\right)^2 + \left(\frac{1}{\sqrt{3}}\right)^2 + \left(\frac{1}{\sqrt{3}}\right)^2} = 1$

UNIT VECTOR

है तो vector ही \hat{A} vector whose magnitude is 1. It represent direxⁿ.

अंधे की लाठी

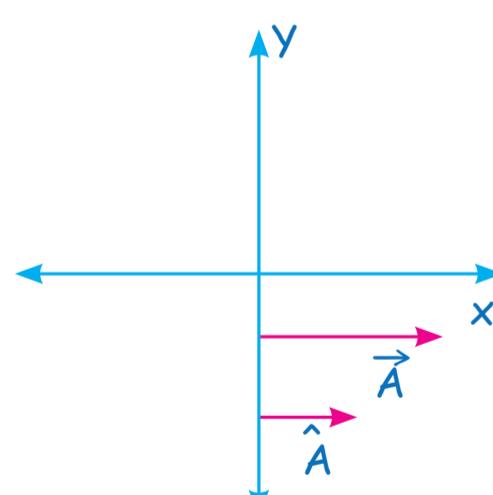

it is used to give direxⁿ and is unitless & dimensionless

$$\vec{A} = |\vec{A}| \text{ direx}^n$$

$$\vec{A} = |\vec{A}| \hat{A}$$

unit vector

$$\hat{A} = \frac{\vec{A}}{|\vec{A}|}$$

Vector

$\hat{A} \rightarrow$ unit vector

ये ऐसा vector है जिसकी Magnitude '1' और $\text{dirx}^n \hat{A}$ की तरफ है।

→ Unit vector along +x-axis = \hat{i}

→ Unit vector along +y-axis = \hat{j}

→ Unit vector along +z-axis = \hat{k}

Q. If \vec{A} is unit vector find value of α where $A=0.6\hat{i} + \alpha\hat{j}$

Sol. $\vec{A} = 0.6\hat{i} + \alpha\hat{j}$

$$\vec{A} = \sqrt{0.36 + \alpha^2}$$

$$1 = 0.36 + \alpha^2$$

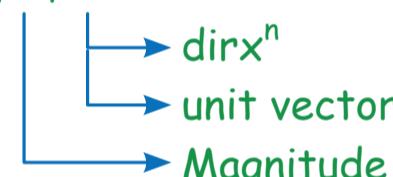

$$0.64 = \alpha^2$$

$$\pm 0.8 = \alpha$$

Q. If a vector is given by $\vec{A} = 3\hat{i} + 4\hat{j}$. Find unit vector along \vec{A} .

Sol. Magnitude of $\vec{A} = \sqrt{3^2 + 4^2} = 5$

$\hat{A} = |\vec{A}| \cdot \hat{A}$

किसी भी vector को उसके magnitude से divide करदो तो उस vector की तरफ का unit vector आजाएगा।

Unit vector along \vec{A} or \hat{A}

$$\hat{A} = \frac{\vec{A}}{|\vec{A}|} = \frac{3\hat{i} + 4\hat{j}}{5} = \frac{3\hat{i}}{5} + \frac{4\hat{j}}{5}$$

\vec{A} and \hat{A} are parallel vector.

Q. Find the unit vector along \vec{A} where $\vec{A} = 2\hat{i} + 6\hat{j} - 3\hat{k}$

Sol. $\hat{A} = \frac{2\hat{i} + 6\hat{j} - 3\hat{k}}{\sqrt{49}} = \frac{2}{7}\hat{i} + \frac{6}{7}\hat{j} - \frac{3}{7}\hat{k}$

Q. A particle has momentum of magnitude 20 kg m/s. If momentum is in the dirx^n of \vec{A} . Find momentum in vector form, where $\vec{A} = \hat{i} + \hat{j}$

Sol. Momentum = $20 \times \hat{A} = 20 \times \left(\frac{\hat{i} + \hat{j}}{\sqrt{2}} \right) = \sqrt{2} (10\hat{i} + 10\hat{j})$

Q. A bird is flying with speed 10 m/s in the dirx^n of a vector $\vec{A} = 3\hat{i} + 4\hat{j}$. Find velocity of bird.

Sol. $\vec{V} = \text{Magnitude of dirx}^n$.

$$\vec{V} = 10 \hat{A} = 10 \left[\frac{3\hat{i} + 4\hat{j}}{5} \right] = 2[3\hat{i} + 4\hat{j}] = 6\hat{i} + 8\hat{j}$$

Q. Find force \vec{F} in vector form if its magnitude is 21 N and dirx^n is

- (a) parallel to $6\hat{i} - 3\hat{j} + 2\hat{k}$
- (b) opposite to $6\hat{i} - 3\hat{j} + 2\hat{k}$

Sol. (a) [Parallel] \vec{F}

$$= 21\hat{A} = 21 \left[\frac{6\hat{i} - 3\hat{j} + 2\hat{k}}{7} \right] = 18\hat{i} - 9\hat{j} + 6\hat{k}$$

(b) [Opposite] \vec{F}

$$= 21(-\hat{A}) = -21\hat{A} = -18\hat{i} + 9\hat{j} - 6\hat{k}$$

Q. A bird is flying with 10 m/s speed from point A to directly point B . Find velocity of Bird.

Sol. $\vec{AB} = 4\hat{i} + 0\hat{j} - 3\hat{k}$

$$\vec{V} = 10 \times \hat{AB} = 10 \times \left(\frac{4\hat{i} - 3\hat{k}}{5} \right) = 8\hat{i} - 6\hat{k}$$

Q. $\vec{A} = 3\hat{i} + 4\hat{j} + 5\hat{k}$.

$\vec{B} = 2\hat{i} + 3\hat{j} - 2\hat{k}$. Find $\vec{A} + \vec{B}$

Sol. $\vec{A} + \vec{B} = 5\hat{i} + 7\hat{j} + 3\hat{k}$

Q. $\vec{A} = 3\hat{i} + 2\hat{j} + 5\hat{k}$.

$\vec{B} = 2\hat{i} + 3\hat{j} + 4\hat{k}$. Find following vectors.

Sol. $\vec{A} + \vec{B} = 5\hat{i} + 5\hat{j} + 9\hat{k}$

$\vec{A} - \vec{B} = \hat{i} - \hat{j} + \hat{k}$

$2\vec{A} + 3\vec{B} = 12\hat{i} + 13\hat{j} + 22\hat{k}$

$|\vec{A} + \vec{B}| = \sqrt{5^2 + 5^2 + 9^2}$

$|\vec{A} - \vec{B}| = \sqrt{3}$

$|2\vec{A} + 3\vec{B}| = \sqrt{12^2 + 13^2 + 22^2}$

$2\vec{A} - 3\vec{B} = 0\hat{i} + (4-9)\hat{j} + (10-12)\hat{k} = -5\hat{j} - 2\hat{k}$

Q. $\vec{A} = 2\hat{i} + \hat{j} + \hat{k}$.

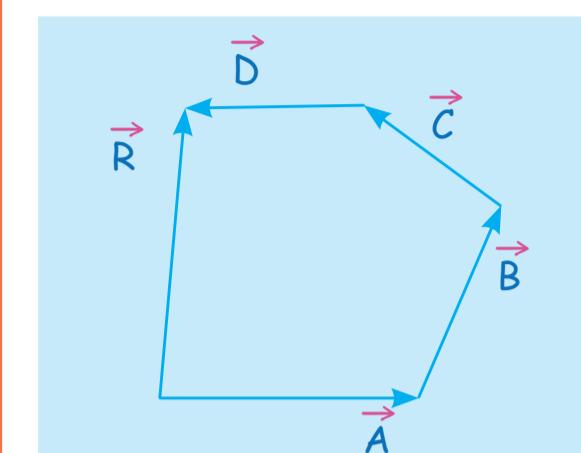

$\vec{B} = 4\hat{i} + \hat{j} + 4\hat{k}$.

Find a vector \vec{C} whose magnitude is 20 and dirx^n is opposite to $4\vec{A} + \vec{B}$.

Sol. $4\vec{A} + \vec{B} = 12\hat{i} + 5\hat{j} + 8\hat{k}$

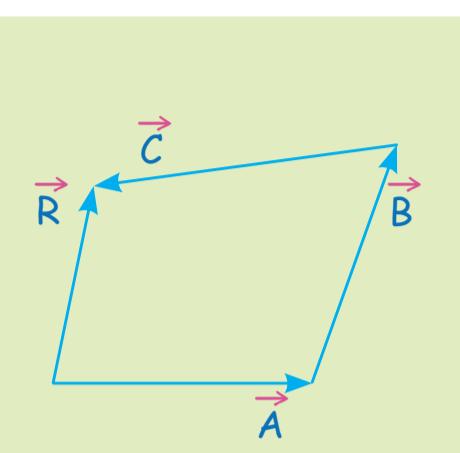

$$\vec{C} = -20 \times \left[\frac{12\hat{i} + 5\hat{j} + 8\hat{k}}{\sqrt{12^2 + 5^2 + 8^2}} \right]$$

COMPONENT OF VECTOR

$$\vec{R} = \vec{A} + \vec{B} + \vec{C} + \vec{D}$$

Here, $\vec{A}, \vec{B}, \vec{C}, \vec{D}$ are said to be four component of \vec{R} .

$$\vec{R} = \vec{A} + \vec{B} + \vec{C}$$

Here, $\vec{A}, \vec{B}, \vec{C}$ are three component of \vec{R} .

Q. A man move 5 m along east, then turn left and move 10 m along north, then turn right move 20 m east and then turn right to south & move 15 m. Find net displacement and distance travel.

Sol. Distance = $5 + 10 + 20 + 15 = 50$ m

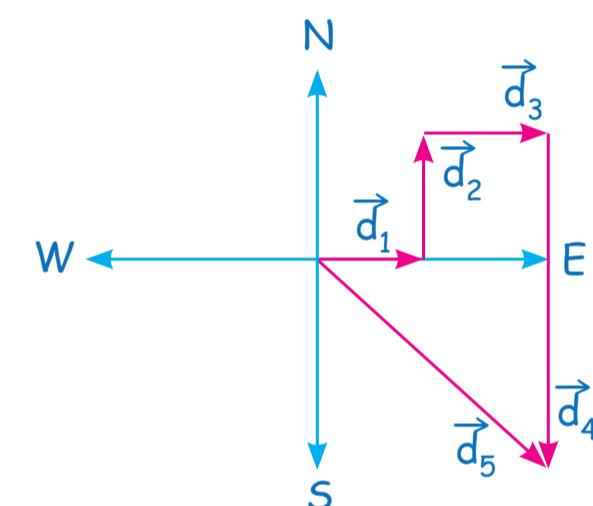

$$\vec{d}_1 = 5\hat{i}$$

$$\vec{d}_2 = 10\hat{j}$$

$$\vec{d}_3 = 20\hat{i}$$

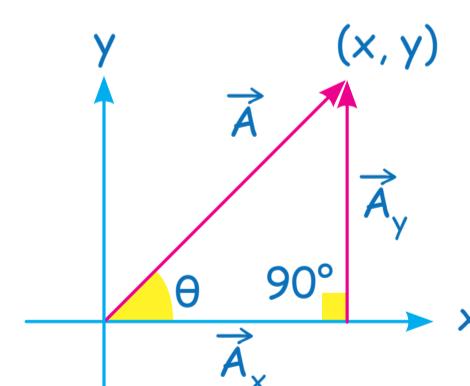

$$\vec{d}_4 = -15\hat{j}$$

$$d_{\text{net}} = 25\hat{i} - 5\hat{j}$$

$$\text{Magnitude} = \sqrt{25^2 + 5^2} = \sqrt{625 + 25} = \sqrt{650}$$

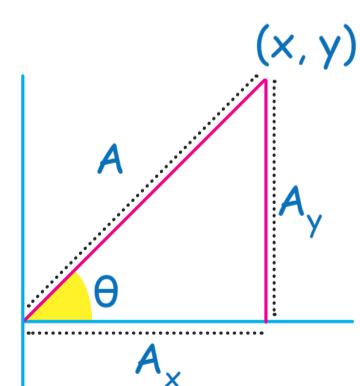

RECTANGULAR COMPONENT/CARTESIAN COMPONENT OF A VECTOR (2D)

$$\vec{A} = x\hat{i} + y\hat{j}$$

$$\vec{A} = \vec{A}_x + \vec{A}_y$$

* \vec{A}_x & \vec{A}_y are two rectangular component of \vec{A} .

$$\vec{A} = A_x \hat{i} + A_y \hat{j},$$

$$\vec{A} = A \cos \theta \hat{i} + A \sin \theta \hat{j},$$

$$\cos \theta = \frac{A_x}{A} \Rightarrow A_x = A \cos \theta$$

$$\sin \theta = \frac{A_y}{A} \Rightarrow A_y = A \sin \theta$$

$$A_x = \text{Component of } \vec{A} \text{ along } x\text{-axis}$$

$$A_y = \text{Component of } \vec{A} \text{ along } y\text{-axis}$$

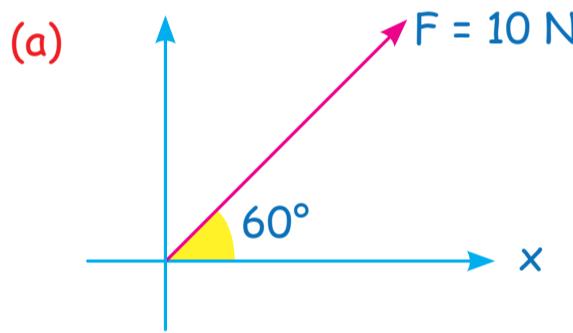

$$\vec{A}_x = A \cos \theta \hat{i}$$

$$\vec{A}_y = A \sin \theta \hat{j}$$

यह बहुत important है और कम से कम एक करोड़ बार use होगा so, अच्छे से समझ लेना कि कैसे एक vector के दो rectangular component ले रहे हैं या कैसे एक vector को तोड़ रहे हैं।

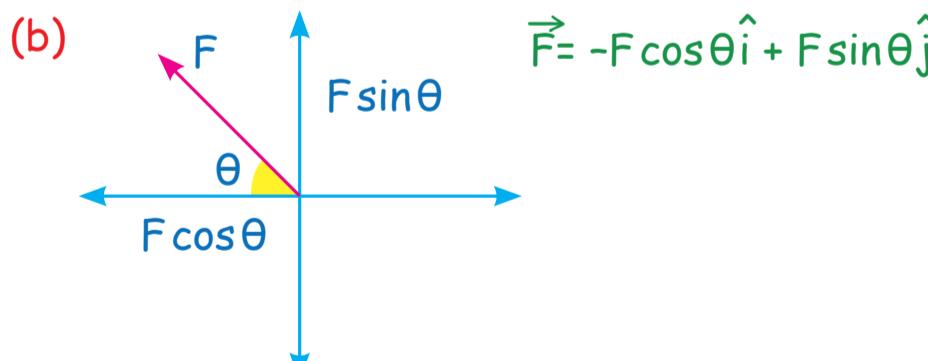

Q. Resolve the vector into \hat{i} & \hat{j}

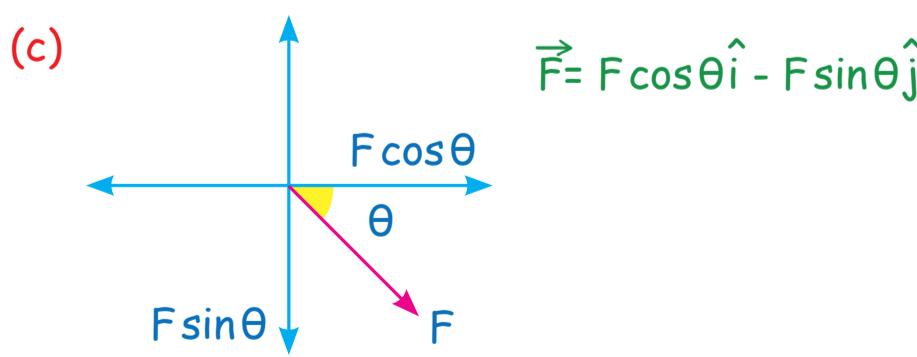

$$\vec{F} = 10 \cos 60 \hat{i} + 10 \sin 60 \hat{j}$$

$$\begin{aligned} \vec{F} &= 10 \times \frac{1}{2} \hat{i} + 10 \times \frac{\sqrt{3}}{2} \hat{j} \\ &= 5 \hat{i} + 5\sqrt{3} \hat{j} \end{aligned}$$

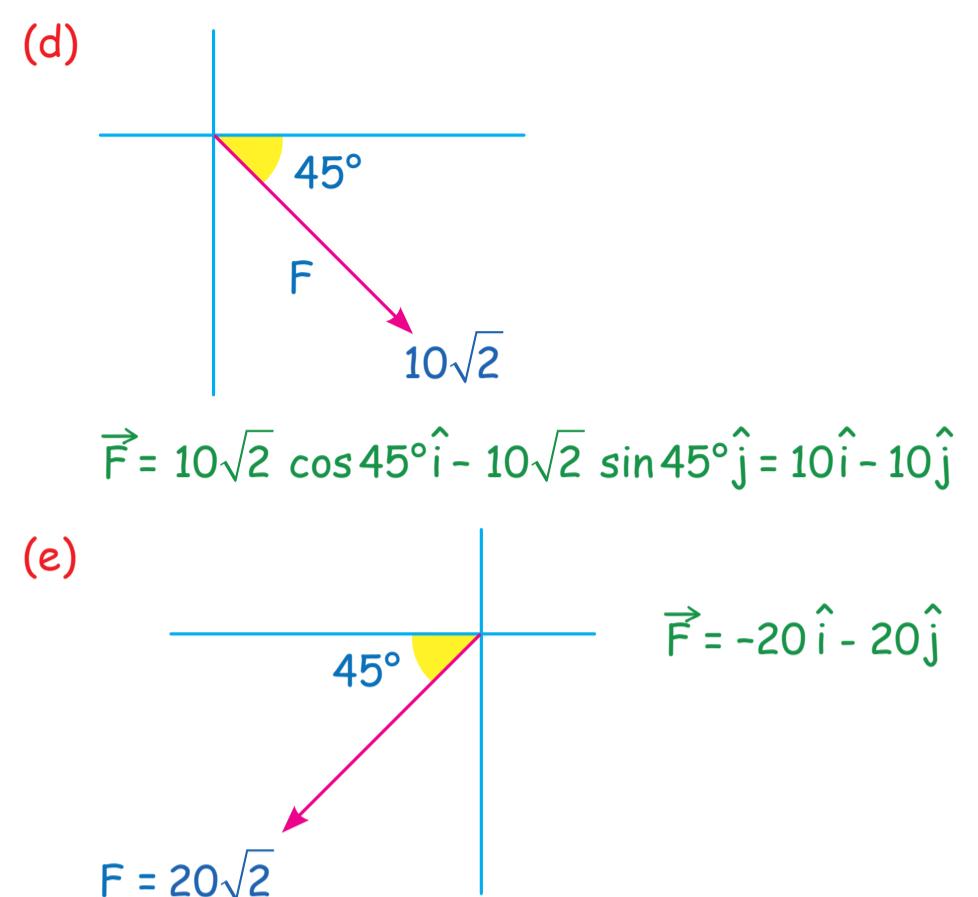

$$\vec{F} = -F \cos \theta \hat{i} + F \sin \theta \hat{j}$$

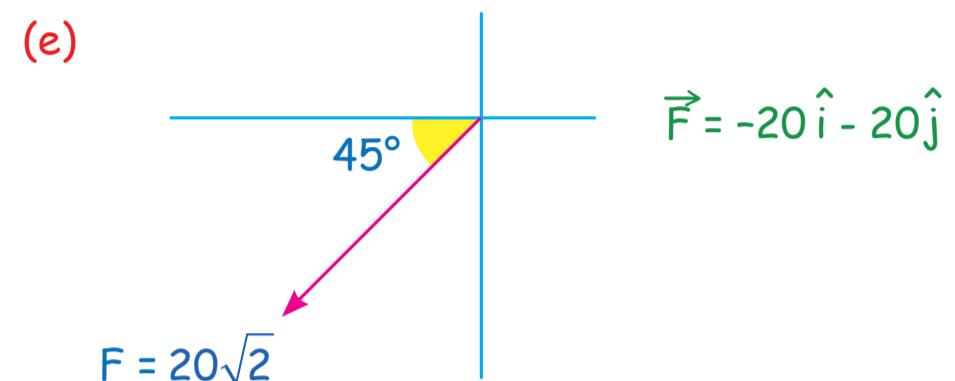

$$\vec{F} = F \cos \theta \hat{i} - F \sin \theta \hat{j}$$

Vector

$$\vec{F} = 10\sqrt{2} \cos 45^\circ \hat{i} - 10\sqrt{2} \sin 45^\circ \hat{j} = 10\hat{i} - 10\hat{j}$$

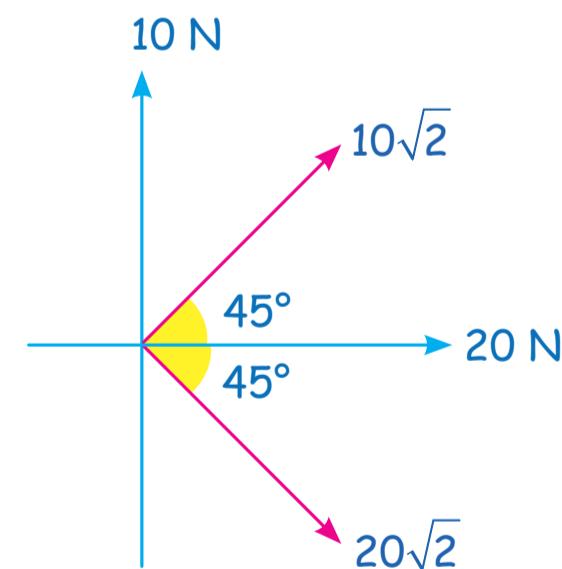

$$\vec{F} = -20 \hat{i} - 20 \hat{j}$$

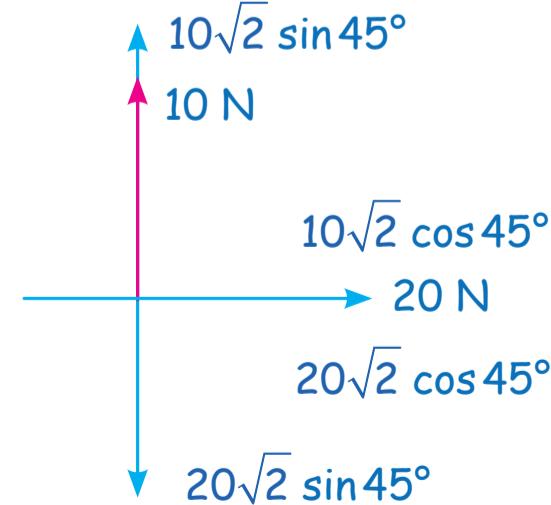

SKC

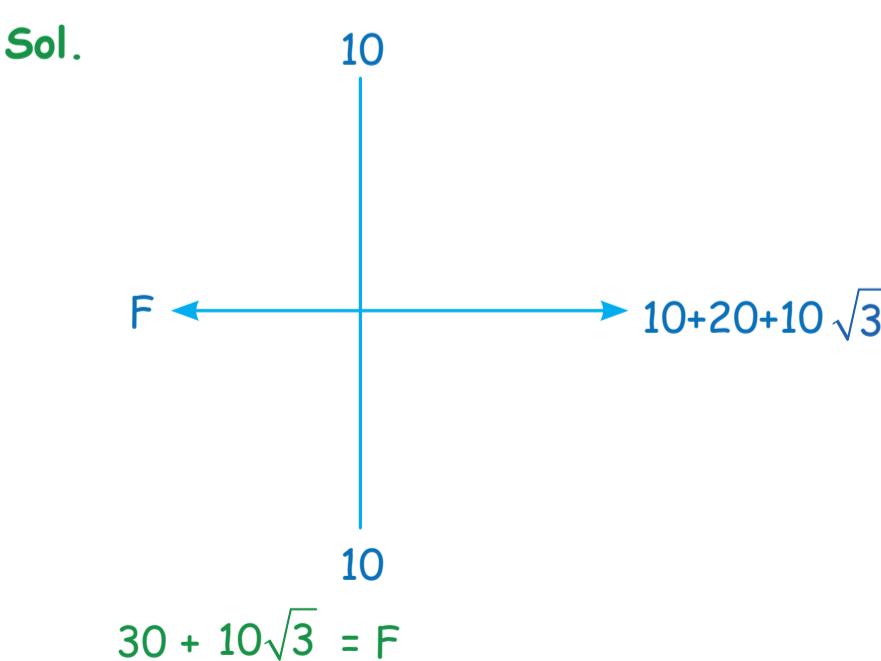

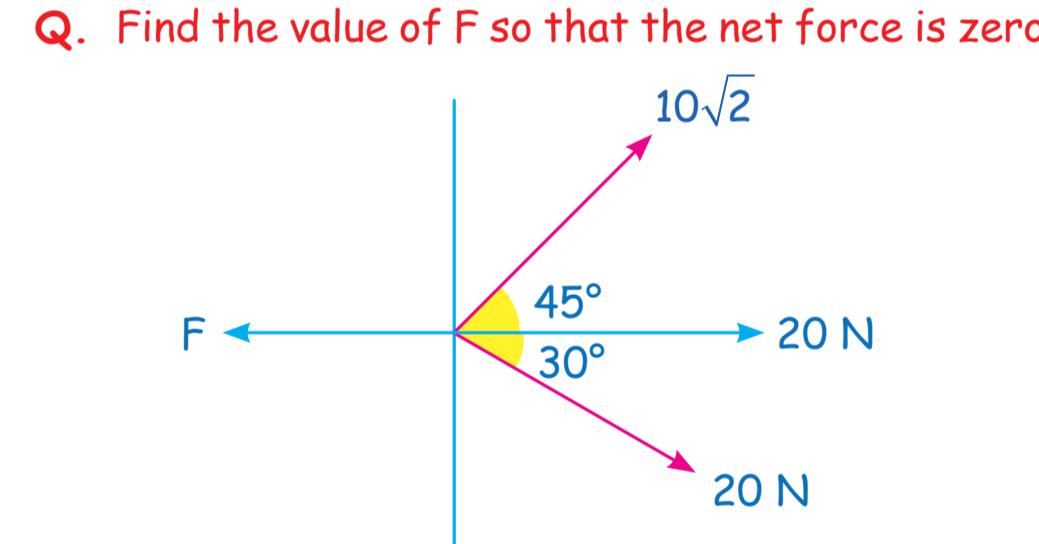

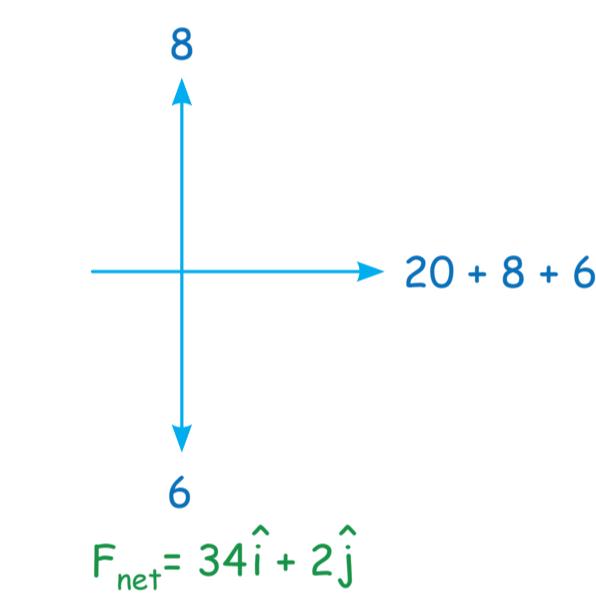

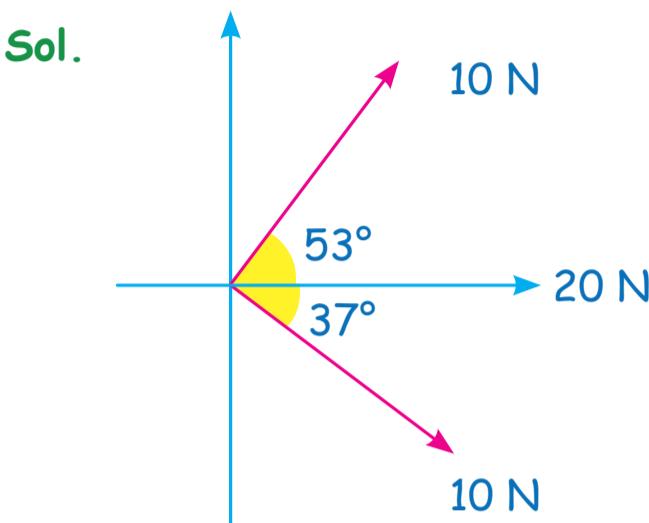

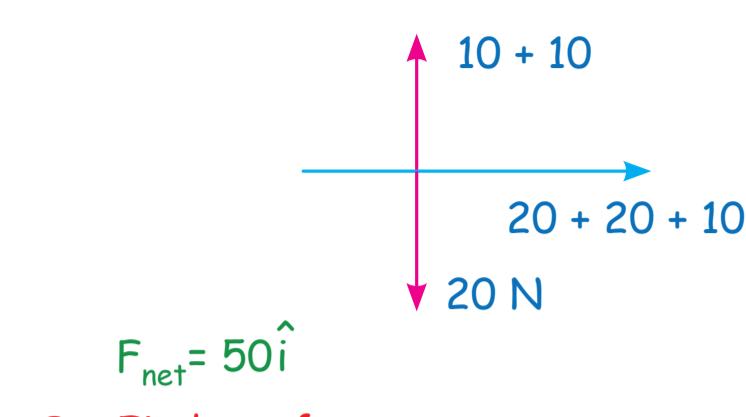

अब हम vector का सबसे ज्यादा important part पढ़ने जा रहे हैं जो electrostatic, mechanics में बहुत use होगा यहाँ हमें बहुत सारे vector का net resultant निकालना होगा। कुछ नहीं करना बस सारे forces को x-y में तोड़ लो और individually x और y में collect करके answer लिख दो।

Q. Find net force.

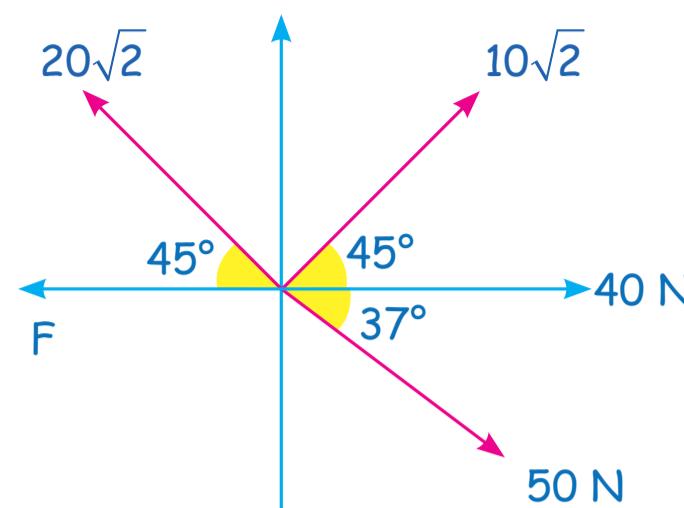

Sol.

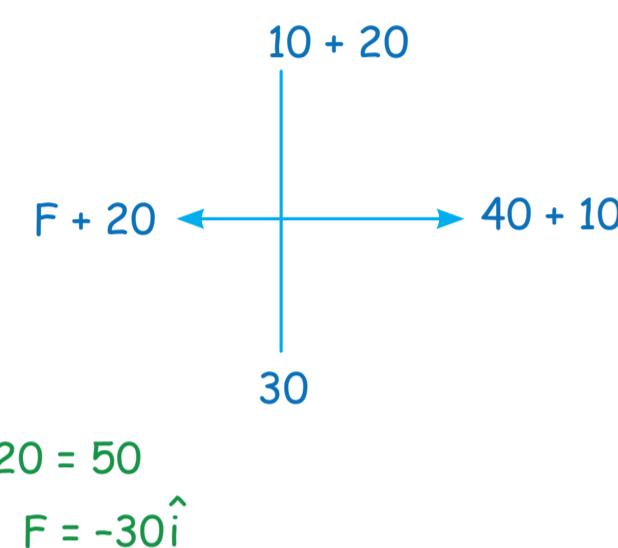

32

Q. Find value of F so that $\vec{F}_{net} = 0$.

Sol.

$$F + 20 = 50$$

$$F = -30i$$

अब अगर मैं 50 vector भी दे दूँ तो सभी को resolve करके कर लोगे ना, मानता हुँ maths/calculation लंबी होगी but physics तो आसान है अगर ये चीज समझ गए हो तो मुझे insta पर confirmation दो saleem.nitt only if you have account.

VECTOR PRODUCT

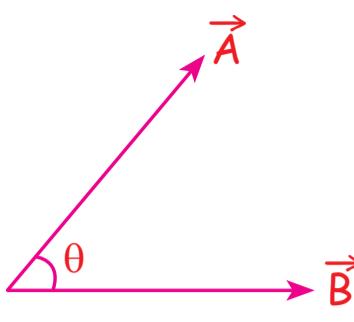

- Dot Product
- Cross Product

Dot Product

$$\vec{A} \cdot \vec{B} = A B \cos \theta$$

Here, A and B are the magnitude of \vec{A} and \vec{B} and θ is the angle between \vec{A} and \vec{B} .

$$\vec{A} \cdot \vec{B} = AB \cos \theta$$

$$\vec{A} \cdot \vec{B} = A(B \cos \theta)$$

= A (magnitude of component \vec{B} along \vec{A})

$$\star \vec{A} \cdot \vec{B} = (A \cos \theta)B$$

= (magnitude of component of \vec{A} along \vec{B})B

$$\star \text{ If } \vec{A} \perp \vec{B} \Rightarrow \vec{A} \cdot \vec{B} = A \cdot B \cos 90^\circ = 0$$

$$\star \hat{i} \cdot \hat{j} = 1 \times 1 \times \cos 90^\circ = 0$$

$$\star \hat{i} \cdot \hat{k} = 1 \times 1 \times \cos 90^\circ = 0$$

$$\star \hat{j} \cdot \hat{k} = 1 \times 1 \times \cos 90^\circ = 0$$

$\star \vec{A} \cdot \vec{B}$ = number ayega scalar.

$$\star \hat{i} \cdot \hat{i} = 1 \times 1 \times \cos 0^\circ = 1$$

$$\star \hat{j} \cdot \hat{j} = 1 \times 1 \times \cos 0^\circ = 1$$

$$\star \hat{k} \cdot \hat{k} = 1 \times 1 \times \cos 0^\circ = 1$$

$$\star [\vec{A} \cdot \vec{A} = A^2]$$

$$\text{If } \vec{A} = A_x \hat{i} + A_y \hat{j} + A_z \hat{k}$$

$$\vec{B} = B_x \hat{i} + B_y \hat{j} + B_z \hat{k}$$

$$\text{then } \vec{A} \cdot \vec{B} = A_x B_x + A_y B_y + A_z B_z$$

$$\therefore \vec{A} \cdot \vec{B} = AB \cos \theta \Rightarrow \cos \theta = \frac{\vec{A} \cdot \vec{B}}{AB}$$

\star Dot product of two vector is commutative

$$\vec{A} \cdot \vec{B} = \vec{B} \cdot \vec{A}$$

$$\star \vec{A} \cdot \vec{A} = A^2$$

$$\star (\vec{A} + \vec{B}) \cdot (\vec{A} + \vec{B}) = A^2 + B^2 + \vec{A} \cdot \vec{B} + \vec{B} \cdot \vec{A}$$

$$= A^2 + B^2 + 2\vec{A} \cdot \vec{B}$$

Q. Find dot product of \vec{A} and \vec{B} .

$$\vec{A} = 2\hat{i} + 3\hat{j}$$

$$\vec{B} = 4\hat{i} + 5\hat{j}$$

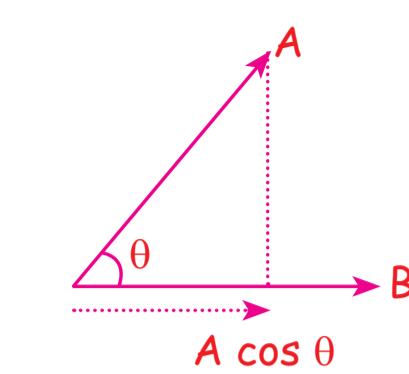

$$\underline{\vec{A} \cdot \vec{B} = 8 + 15 = 23}$$

$$\text{Q. } \vec{A} = 2\hat{i} - 3\hat{j} + 4\hat{k}$$

$$\vec{B} = \alpha\hat{i} + 2\hat{j} + 5\hat{k}$$

if $\vec{A} \perp \vec{B}$ find α

$$\text{Sol. } \vec{A} \cdot \vec{B} = 2\alpha - 6 + 20 = 0 \Rightarrow \alpha = -7$$

Q. Find angle between \vec{A} & \vec{B} if $\vec{A} = \hat{i} + \hat{j}$, $\vec{B} = 3\hat{i} + 4\hat{j}$

$$\text{Sol. } \vec{A} \cdot \vec{B} = AB \cos \theta$$

Magnitude of $B = 5$

Magnitude of $A = \sqrt{2}$

$$\therefore \cos \theta = \frac{7}{5\sqrt{2}}$$

$$\cos \theta = \frac{\vec{A} \cdot \vec{B}}{AB}$$

$$\text{Q. } \vec{A} = 3\hat{i} + 4\hat{j} + 5\hat{k}$$

$$\vec{B} = 2\hat{i} + 3\hat{j} + 6\hat{k} \quad \text{Find angle between } \vec{A} \text{ & } \vec{B}$$

$$\text{Sol. } \vec{A} \cdot \vec{B} = 6 + 12 + 30 = 48, A = 5\sqrt{2}, B = 7$$

$$\vec{A} \cdot \vec{B} = AB \cos \theta$$

$$48 = 5\sqrt{2} \times 7 \cos \theta$$

$$\frac{48}{35\sqrt{2}} = \cos \theta$$

Q. Find angle between \vec{A} & \vec{B} if

$$\vec{A} = \hat{i} + \hat{j} + \hat{k}, \vec{B} = \hat{i} - \hat{j} + \hat{k}$$

$$\text{Sol. } \vec{A} \cdot \vec{B} = AB \cos \theta$$

$$1 = \sqrt{3} \times \sqrt{3} \cos \theta$$

$$\frac{1}{3} = \cos \theta$$

$$\theta = \cos^{-1}\left(\frac{1}{3}\right)$$

$$\# \vec{A} = A_x \hat{i} + A_y \hat{j} + A_z \hat{k}$$

$$\vec{B} = B_x \hat{i} + B_y \hat{j} + B_z \hat{k}$$

IF-

$$\frac{A_x}{B_x} = \frac{A_y}{B_y} = \frac{A_z}{B_z} = n$$

• $n > 0 \Rightarrow \vec{A}$ is parallel to \vec{B}

• $n < 0 \Rightarrow \vec{A}$ is anti-parallel to \vec{B}

$$\text{Q. } \vec{A} = 3\hat{i} - 4\hat{j} + 5\hat{k}$$

$\vec{B} = -9\hat{i} + 12\hat{j} - 15\hat{k}$. Are these vectors parallel or anti parallel?

$$\text{Sol. } \frac{3}{-9} = \frac{-4}{12} = \frac{-5}{15}$$

$$\frac{-1}{3} = \frac{-1}{3} = \frac{-1}{3} \quad [\text{Antiparallel}]$$

SKC

\vec{A}, \vec{B} $||^r$ हैं या anti- $||^r$ हैं या \perp हैं या कुछ नहीं, ये पता करने के लिए

$$\cos\theta = \frac{\vec{A} \cdot \vec{B}}{AB} \text{ निकाल लो। } \Rightarrow \text{ If } \theta = 0^\circ = \text{parallel}$$

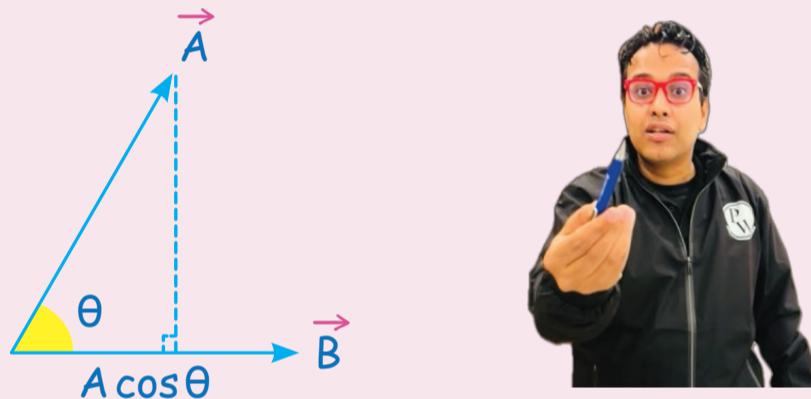

$$\theta = 180^\circ = \text{Anti } ||^r \quad \text{If } \theta = 90^\circ = \perp$$

Q. $\vec{A} = 2\hat{i} + 3\hat{j} + 4\hat{k}$

$\vec{B} = 4\hat{i} + 6\hat{j} - 8\hat{k}$. Are they parallel?

Sol. $\frac{2}{4} = \frac{3}{6} \neq \frac{-4}{8}$

$\frac{1}{2} = \frac{1}{2} \neq \frac{-1}{2}$ [Nothing]

Component of \vec{A} along $\vec{B} = A \cos \theta$ (magnitude)

$$= A \cos \theta \cdot \hat{B} \text{ (In vector form)} = \vec{A}_{||}$$

$$\therefore A \cos \theta = \frac{\vec{A} \cdot \vec{B}}{B}$$

$$\text{Component of } \vec{A} \text{ along } \vec{B} = \frac{\vec{A} \cdot \vec{B}}{B} = \vec{A} \cdot \hat{B}$$

$$\text{Component of } \vec{B} \text{ along } \vec{A} = \frac{\vec{A} \cdot \vec{B}}{A} = \vec{B} \cdot \hat{A}$$

$$\text{Component of } \vec{A} \text{ along } \vec{B} \text{ in vector form } (\vec{A}_{||}) = \left(\frac{\vec{A} \cdot \vec{B}}{B} \right) \hat{B}$$

$$\text{Component of } \vec{A} \text{ perpendicular to } \vec{B} = \vec{A} - \vec{A}_{||}$$

$$\vec{A}_{||} + \vec{A}_{\perp} = \vec{A}$$

इसका use आगे mechanics में होगा इसलिए rough copy पर पाँच बार लिख-लिख कर practice करे (for 11th students)

Q. Find component of \vec{A} along \vec{B}

$$\vec{A} = 3\hat{i} + 4\hat{j} \quad \vec{B} = \hat{i} + \hat{j}$$

Sol. Component of \vec{A} along \vec{B} (scalar) = $A \cos \theta$

$$= \frac{\vec{A} \cdot \vec{B}}{B} = \frac{3+4}{\sqrt{2}} = \frac{7}{\sqrt{2}} \text{ (magnitude)}$$

$$\text{Component of } \vec{A} \text{ along } \vec{B} \text{ (Vector)} = \frac{\vec{A} \cdot \vec{B}}{B} \times \hat{B}$$

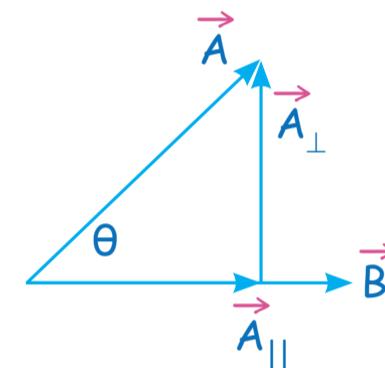

$$= \frac{7}{\sqrt{2}} \left(\frac{\hat{i} + \hat{j}}{\sqrt{2}} \right) = \frac{7}{2} (\hat{i} + \hat{j})$$

Q. If $\vec{A} = \hat{i} + 3\hat{j}$ and $\vec{B} = 3\hat{i} + 4\hat{j}$,

Find component of \vec{A} perpendicular to \vec{B} .

Sol. Component of \vec{A} parallel (along) to $\vec{B} = \frac{3}{5} (3\hat{i} + 4\hat{j})$

Component of \vec{A} perpendicular to $\vec{B} = A \sin \theta$

$$\vec{A}_{||} + \vec{A}_{\perp} = \vec{A} \Rightarrow \vec{A}_{\perp} = \vec{A} - \vec{A}_{||}$$

$$\vec{A}_{\perp} = \hat{i} + 3\hat{j} - \left[\frac{3}{5} (3\hat{i} + 4\hat{j}) \right] = \hat{i} + 3\hat{j} - \left(\frac{9\hat{i} + 12\hat{j}}{5} \right)$$

$$= \frac{-4\hat{i}}{5} + 3\hat{j}$$

Q. $\vec{A} = 4\hat{i} - 2\hat{j}$, $\vec{B} = 3\hat{i} + 4\hat{j}$

Find component of \vec{A} perpendicular to \vec{B} .

Sol. Component of \vec{A} parallel to \vec{B}

$$= \frac{\vec{A} \cdot \vec{B}}{B} = \frac{12-8}{5} = \frac{4}{5}$$

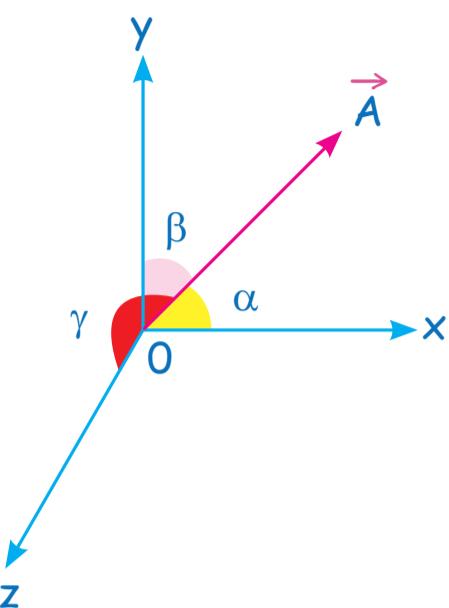

$$\text{Vector form} = \frac{4}{5} \left(\frac{3\hat{i} + 4\hat{j}}{5} \right) = \frac{12\hat{i} + 16\hat{j}}{25}$$

Component of \vec{A} perpendicular to \vec{B}

$$= \vec{A}_{\perp} = \vec{A} - \vec{A}_{||}$$

$$= 4\hat{i} - 2\hat{j} - \left[\frac{12\hat{i} + 16\hat{j}}{25} \right] = \frac{88\hat{i} - 66\hat{j}}{25}$$

DIRECTION COSINE

$$\vec{A} = A_x \hat{i} + A_y \hat{j} + A_z \hat{k}$$

If \vec{A} makes angle α with + x-axis

If \vec{A} makes angle β with + y-axis

If \vec{A} makes angle γ with + z-axis

Component of \vec{A} along x-axis = $A \cos \alpha = A_x$

Component of \vec{B} along y-axis = $A \cos \beta = A_y$

Component of \vec{C} along z-axis = $A \cos \gamma = A_z$

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$$

$$\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma = 2$$

$$\cos \alpha = \frac{A_x}{A} \quad \cos \beta = \frac{A_y}{A} \quad \cos \gamma = \frac{A_z}{A} \text{ here, } \cos \alpha, \cos \beta,$$

$\cos \gamma$ are the direction cosine of \vec{A}

Q. $\vec{A} = 2\hat{i} + 3\hat{j} + 6\hat{k}$. Find direction cosine

$$\text{Sol. } A = |\vec{A}| = \sqrt{2^2 + 3^2 + 6^2} = 7$$

$$\cos \alpha = \frac{A_x}{A} = \frac{2}{7} \quad \cos \beta = \frac{A_y}{A} = \frac{3}{7} \quad \cos \gamma = \frac{A_z}{A} = \frac{6}{7}$$

Q. $\vec{A} = 3\hat{i} + 4\hat{j} + 5\hat{k}$, Find direction cosine

$$\text{Sol. } A = \sqrt{9 + 16 + 25} = 5\sqrt{2}$$

(a) Direction cosine

$$\cos \alpha = \frac{3}{5\sqrt{2}} \quad \cos \beta = \frac{4}{5\sqrt{2}} \quad \cos \gamma = \frac{5}{5\sqrt{2}}$$

(b) Component of \vec{A} along x-axis = $3\hat{i}$

(c) Component of \vec{A} along y-axis = $4\hat{j}$

(d) Component of \vec{A} along z-axis = $5\hat{k}$

(e) Component of \vec{A} on x-y plane = $3\hat{i} + 4\hat{j}$

(f) Component of \vec{A} on y-z plane = $4\hat{j} + 5\hat{k}$

Cross Product

भाई cross product की ज्यादा tension मत लेना बस ये सिख लेना कि कैसे cross product निकालते हैं rotation से पहले इसका बहुत ही कम use होगा, थोड़ा सा circular motion में use होगा।

If cross product of vector \vec{A} and \vec{B} is \vec{C} means $\vec{A} \times \vec{B} = \vec{C}$ then \vec{C} is a vector which is perpendicular to both \vec{A} and \vec{B} and magnitude of \vec{C} is given by

$$|\vec{C}| = AB \sin \theta$$

★ $\vec{C} = (AB \sin \theta)\hat{C}$

★ $\vec{a} \times \vec{b} = \vec{c} = ab \sin \theta \cdot \hat{c}$

★ $\vec{c} \cdot \vec{a} = 0, \vec{c} \cdot \vec{b} = 0$

★ $\vec{c} \perp \vec{a}, \vec{c} \perp \vec{b}$

★ $(\vec{a} \times \vec{b}) \cdot \vec{a} = 0, (\vec{a} \times \vec{b}) \cdot \vec{b} = 0$

★ $\vec{a} \times \vec{a} = 0$

★ $\hat{i} \times \hat{i} = 0, \hat{j} \times \hat{j} = 0, \hat{k} \times \hat{k} = 0$

दो vector का cross product खुद में एक vector होता है।

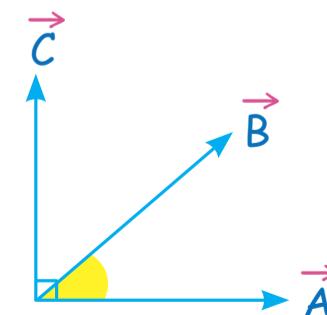

★ In terms of components $\vec{A} \times \vec{B} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ A_x & A_y & A_z \\ B_x & B_y & B_z \end{vmatrix}$

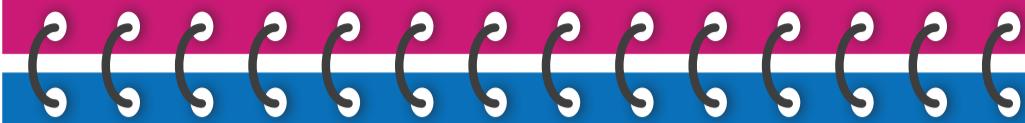

$$= \hat{i}(A_y B_z - A_z B_y) + \hat{j}(A_z B_x - A_x B_z) + \hat{k}(A_x B_y - A_y B_x)$$

अगर आपने determinant नहीं पढ़ा तो tension लेने की कोई जरूरत नहीं है जब पढ़लो तब ये method apply करके cross product निकाल लेना।

★ $\vec{A} \times \vec{B} = \vec{C}$

SKC

★ $\hat{i} \times \hat{j} = \hat{k}$

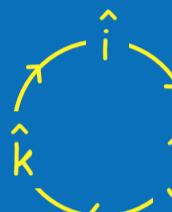

★ $\hat{j} \times \hat{k} = \hat{i}$

★ $\hat{k} \times \hat{i} = \hat{j}$

★ $\hat{j} \times \hat{i} = -\hat{k}$

★ $\hat{i} \times \hat{k} = -\hat{j}$

★ $\hat{k} \times \hat{j} = -\hat{i}$

अब याद करने का तरीका सुन, जबान से बोलो $\hat{i} \hat{j} \hat{k} \hat{i} \hat{j} \hat{k} \hat{i} \hat{j} \hat{k} \hat{i} \hat{j}$ और ये sequence catch करो जैसे i और j के बाद k आया तो $\hat{i} \times \hat{j} = \hat{k}$ उसी sequence में j और k के बाद i आया है तो $\hat{j} \times \hat{k} = \hat{i}$ अगर sequence गड़बड़/उल्टा हुआ तो minus लगा दो जैसे $\hat{j} \times \hat{i} = -\hat{k}$ अब समझ गए ना।

Q. $\vec{a} = 3\hat{i} + 4\hat{j}$

$\vec{b} = 2\hat{i} + 5\hat{j}$ find $\vec{a} \times \vec{b}$

Sol. $\vec{a} \times \vec{b} = (3\hat{i} + 4\hat{j}) \times (2\hat{i} + 5\hat{j})$

$$= 6\hat{i} \times \hat{i} + 15\hat{i} \times \hat{j} + 8\hat{j} \times \hat{i} + 20\hat{j} \times \hat{j}$$

$$= 0 + 15\hat{k} - 8\hat{k} + 0$$

$$= 7\hat{k} = \vec{c}$$

$$\vec{c} \perp \vec{a}$$

$$\vec{c} \perp \vec{b}$$

Q. $\vec{a} = 4\hat{i} + 7\hat{j}$

$\vec{b} = 2\hat{i} + 3\hat{j}$ find $\vec{a} \times \vec{b}$

Sol. $\vec{a} \times \vec{b} = 8\hat{i} \times \hat{i} + 12\hat{i} \times \hat{j} + 14\hat{j} \times \hat{i} + 21\hat{j} \times \hat{j}$

$$= 0 + 12\hat{k} - 14\hat{k} + 0 = -2\hat{k} = \vec{c}$$

$$\vec{c} \perp \vec{a}, \vec{c} \perp \vec{b}$$

$\vec{b} \times \vec{a} = (2\hat{i} + 3\hat{j}) \times (4\hat{i} + 7\hat{j})$

$$= 0 + 14\hat{k} - 12\hat{k} + 0 = 2\hat{k}$$

$$\therefore \vec{a} \times \vec{b} = -(\vec{b} \times \vec{a})$$

अब मैं नीचे कुछ important question attach

कर रहा हूँ इनको अच्छे से solve करो.....

अबे करोगे ना.....

C कुछ PRACTICE करलो

Q. If the sum of two unit vectors is a unit vector, then find the magnitude of their difference.

Sol. Let \hat{n}_1 and \hat{n}_2 are the two unit vectors, then the sum is $\vec{n}_s = \hat{n}_1 + \hat{n}_2$ or $n_s^2 = n_1^2 + n_2^2 + 2n_1 n_2 \cos\theta = 1+1+2\cos\theta$

Since it is given that n_s is also a unit vector, therefore $1 = 1 + 1 + 2 \cos\theta$

$$\text{or } \cos\theta = -\frac{1}{2} \text{ or } \theta = 120^\circ$$

Now the difference of the vectors is $\vec{n}_d = \hat{n}_1 - \hat{n}_2$

$$\text{or } n_d^2 = n_1^2 + n_2^2 - 2n_1 n_2 \cos\theta = 1+1-2\cos(120^\circ)$$

$$\therefore n_d^2 = 2 - 2(-1/2) = 2+1=3 \Rightarrow n_d = \sqrt{3}$$

Q. If vector $\vec{A} = 2\hat{i} + 3\hat{j} - \hat{k}$ and $\vec{B} = -4\hat{i} - 6\hat{j} - \lambda\hat{k}$ are perpendicular to each other then value of λ will be?

Sol. If \vec{A} and \vec{B} are perpendicular to each other then $\vec{A} \cdot \vec{B} = 0$

$$\text{So, } 2(-4) + 3(-6) + (-1)(-\lambda) = 0 \Rightarrow \lambda = +26$$

Q. If \vec{a}_1 and \vec{a}_2 are two non collinear unit vectors and if $|\vec{a}_1 + \vec{a}_2| = \sqrt{3}$, then find the value of $(\vec{a}_1 - \vec{a}_2) \cdot (2\vec{a}_1 + \vec{a}_2)$.

Sol. $a_1 = a_2 = 1$ and $a_1^2 + a_2^2 + 2a_1 a_2 \cos\theta = 3$

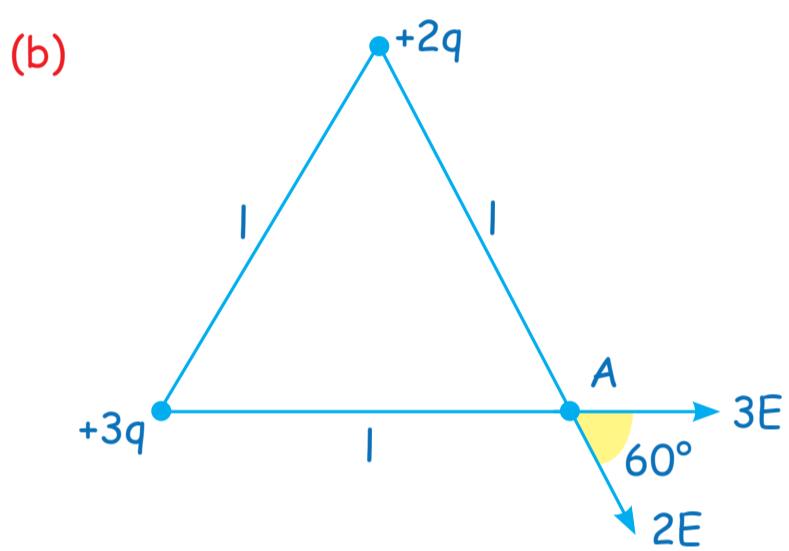

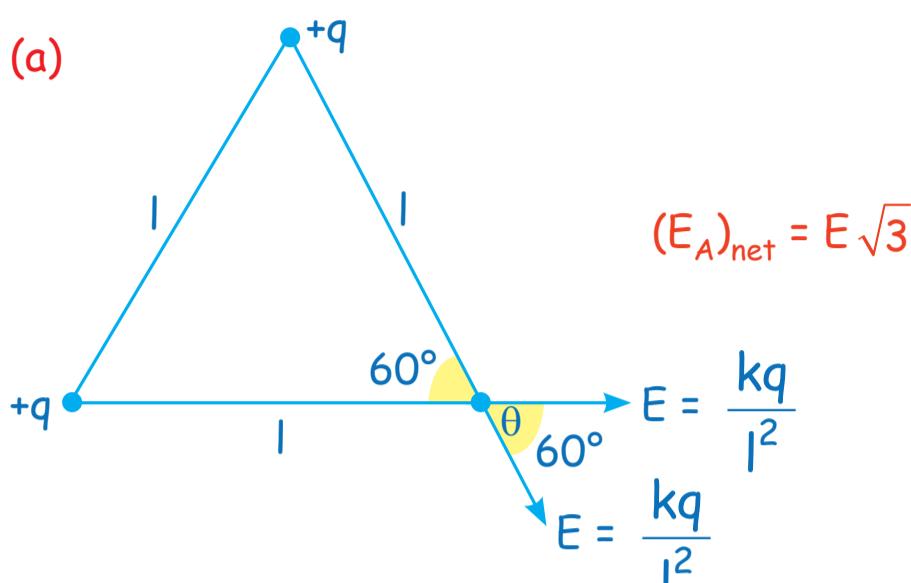

$$\text{Or } 1+1+2\cos\theta = 3 \text{ or } \cos\theta = \frac{1}{2}$$

$$\text{Now } (\vec{a}_1 - \vec{a}_2) \cdot (2\vec{a}_1 + \vec{a}_2) = 2a_1^2 - a_2^2 - a_1 a_2 \cos\theta$$

$$= 2 - 1 - \frac{1}{2} = \frac{1}{2}$$

Q. In 12th class we will study in electrostatics that a point charge produce electric field which is a vector quantity and electric field due to a positive point charge at a distance r from charge has value $\frac{kq}{r^2}$ radially away from charge (along the line joining point to the charge) k is constant

Using above data find the net electric field at point A in following case.

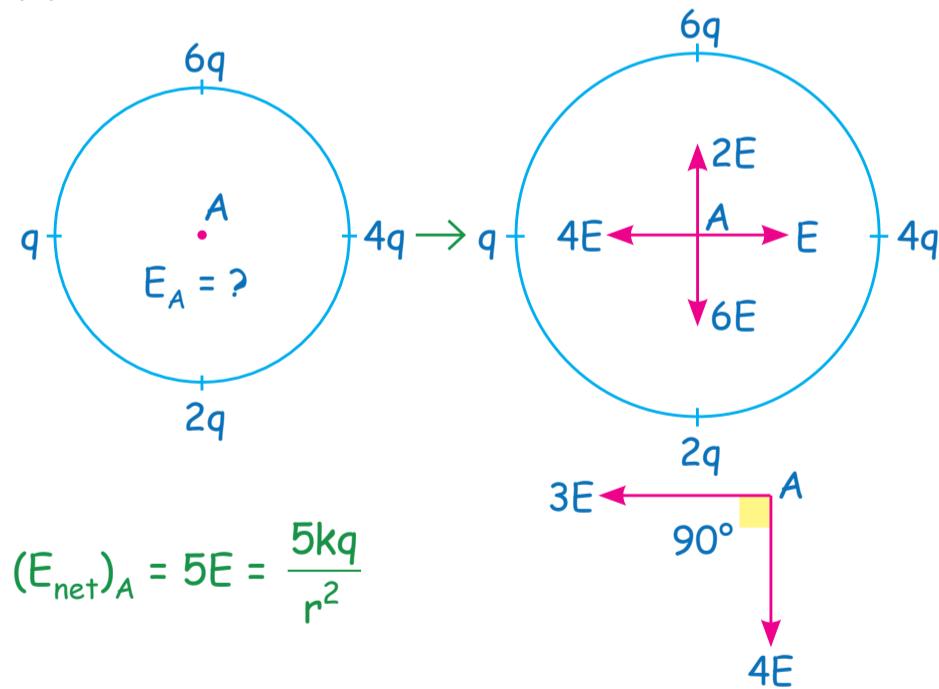

$$\text{Let } E = \frac{kq}{l^2}$$

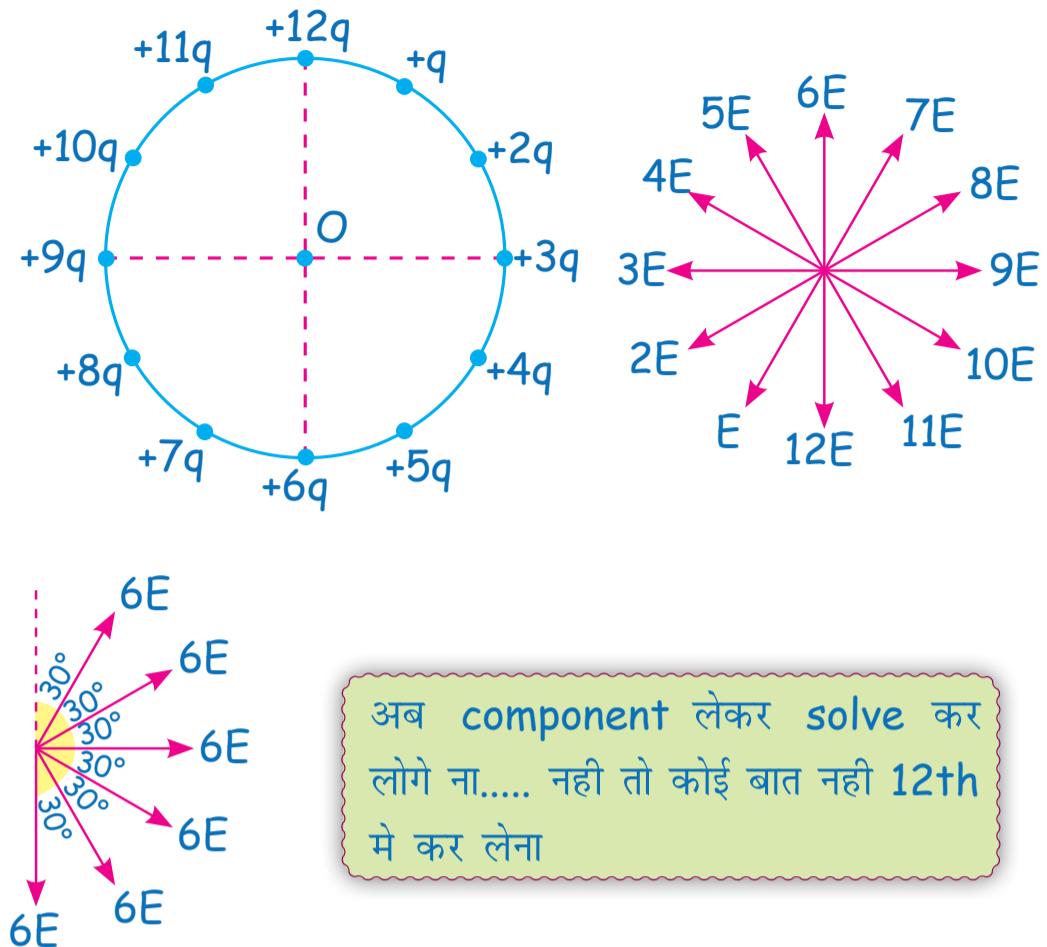

$$E_{\text{net}} = \sqrt{(2E)^2 + (3E)^2 + 2 \times 2E \times 3E \times \cos 60^\circ}$$

$$= E\sqrt{19}$$

(c)

(d) Find E_{net} at centre O.

अब component लेकर solve कर लोगे ना..... नहीं तो कोई बात नहीं 12th में कर लेना

$$\vec{E}_{\text{net}} = (12E + 6E\sqrt{3})\hat{i} - 6E\hat{j}$$

IMPORTANT RESULT

If $|\vec{A}| = |\vec{B}| = x$

and angle between \vec{A} and \vec{B} is θ

then $|\vec{A} + \vec{B}| = 2x \cos \theta/2$

$|\vec{A} - \vec{B}| = 2x \cos \theta/2$

Q. Two vectors \vec{P} and \vec{Q} have equal magnitudes. If the magnitude of $\vec{P} + \vec{Q}$ is n times the magnitude of $\vec{P} - \vec{Q}$, then angle between \vec{P} and \vec{Q} is:

$$\text{Ans. } \cos^{-1}\left(\frac{n^2 - 1}{n^2 + 1}\right)$$

3

Kinematics

MOTION IN A STRAIGHT LINE

Motion: If a body changes its position with time body is called in motion

★ Rest and motion are relative terms. They depend on observer.

जैसे की यहाँ बाबू भईया आपके respect में motion में है but ठेले के respect में rest पर है।

Distance: Actual path travelled by the body -

- ★ Dependent upon path (we should know the path)
- ★ It can't be decreasing
- ★ It can't be negative
- ★ It can be zero or positive

DISPLACEMENT

Change in position vector \vec{r} or change in position

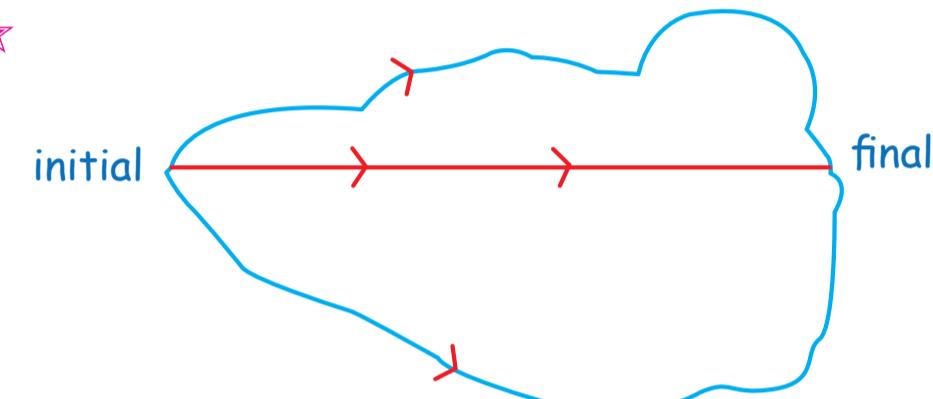

$$\vec{d} = \vec{\Delta r} = \vec{r}_f - \vec{r}_i$$

- ★ Displacement = final position - Initial position
- ★ It is the shortest distance between initial and final point.
- ★ Vector term
- ★ It can be positive, negative or zero.
- ★ It can be increasing or decreasing.
- ★ Independent of path travelled.

Q. A particle move from point A to point B. Find its displacement in following case.

Initial (2, 3, 4)		Final (7, 5, 9)
A		B

Sol. $\vec{d} = \text{displacement} = 5\hat{i} + 2\hat{j} + 5\hat{k}$

Displacement - same

Distance - different (depend upon path)

★ initial $x = 0$ \rightarrow \rightarrow $x = 10$ final

distance $\rightarrow 10 + 4 = 14$

displacement $\rightarrow 6$

(vector form) $\rightarrow 6\hat{i}$

★ initial $x = 0$ \rightarrow \rightarrow \rightarrow Final $x = 10$

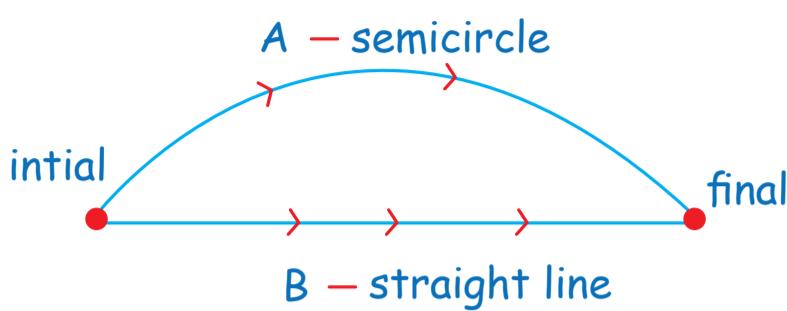

Distance = 10

Displacement = $10\hat{i}$

Here, Distance = |Displacement|

- ★ $|\text{Displacement}| = \text{magnitude of displacement}$
- ★ If a particle does not change direction then distance = |displacement|
- ★ $\text{Distance} \geq |\text{displacement}|$
- ★ $\frac{\text{Distance}}{|\text{Displacement}|} \geq 1$

Q. A particle move from initial to final position in two different path A and B as shown in fig. Find distance and displacement for both.

Sol.

	A	B
Distance	πR	$2R$
Displacement	$2R$	$2R$

Q. A particle move 5m along east then 6m along north and 10m in upward direction. Find distance & displacement?

Sol. Distance $5\text{m} + 6\text{m} + 10\text{m} = 21$

$$\text{Displacement} = 5\hat{i} + 6\hat{j} + 10\hat{k}$$

$$\text{Magnitude} = \sqrt{5^2 + 6^2 + 10^2}$$

Q. A particle move

$$10\text{m east} = 10\hat{i}$$

$$5\text{m north} = 5\hat{j}$$

$$6\text{m south} = -6\hat{j}$$

$$8\text{m west} = -8\hat{i}$$

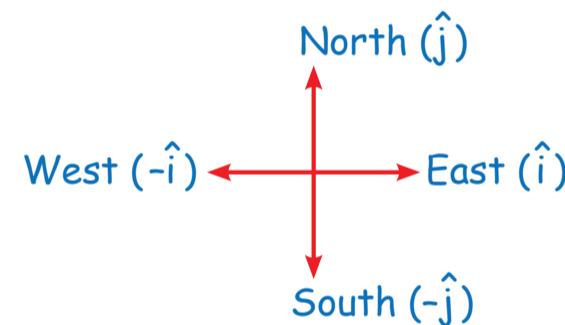

$$15\text{m east} = 15\hat{i}$$

$$20\text{m north} = 20\hat{j}$$

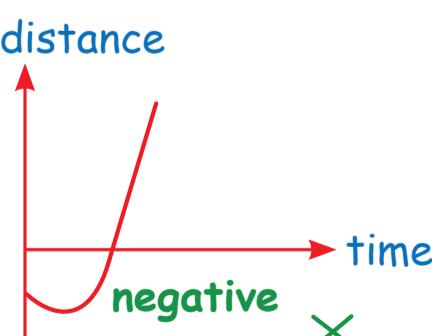

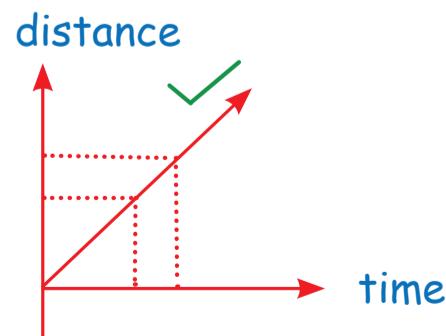

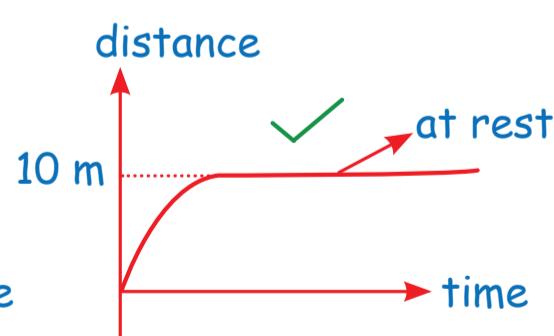

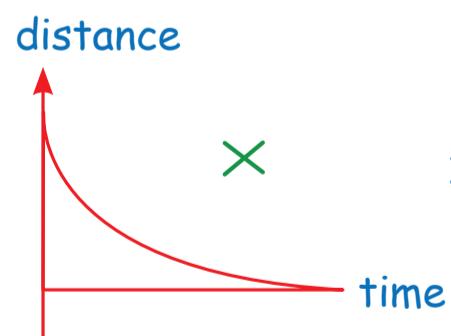

$$\text{distance} = 64\text{ m}$$

$$\text{displacement} = (10 - 8 + 15)\hat{i} + (5 - 6 + 20)\hat{j}$$

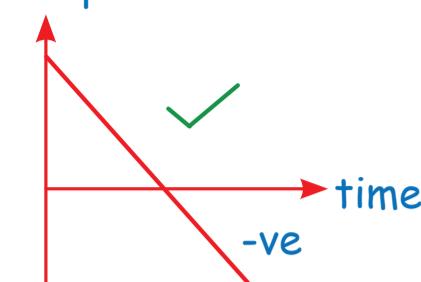

$$= 17\hat{i} + 19\hat{j}$$

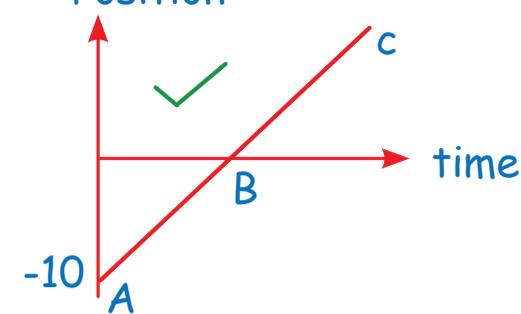

Q. Which of the graph is possible.

Displacement

Position

displacement = change in position.

Average velocity = $\frac{\text{total displacement}}{\text{total time}}$

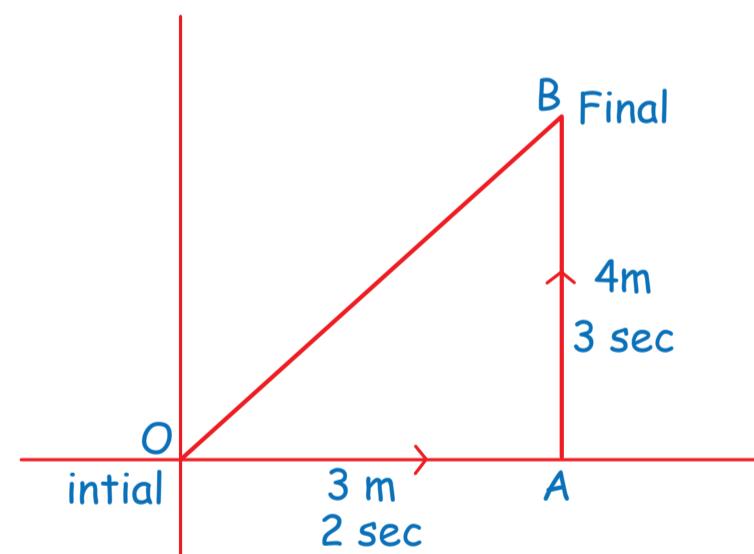

Instantaneous velocity = $\frac{dr}{dt}$

Average speed = $\frac{\text{total distance}}{\text{total time}}$

Instantaneous speed = kisi inst. par speed

$| \text{Instantaneous velocity} | = \text{Instantaneous speed}$

Q. A particle move from origin to point A and took 2 sec, then it move to point B and took 3 sec in following fig. Find displacement, average velocity and average speed.

$$\text{Sol. Displacement } \vec{d} = 3\hat{i} + 4\hat{j}$$

$$\text{Avrg. velocity} = \frac{3\hat{i} + 4\hat{j}}{5}$$

$$\text{Avrg. speed} = \frac{\text{Total distance}}{\text{Total time}} = \frac{3+4}{2+3} = \frac{7}{5}$$

$$\text{Q. } x = 0 \quad t = 10 \text{ sec} \quad x = 6$$

Sol. Displacement = 6 (mag)

$$\text{Average velocity} = \frac{6}{10}$$

$$\text{Distance} = 10 + 4 = 14$$

$$\text{Average speed} = \frac{14}{10}$$

Sol. Distance = 10

$$\text{Average speed} = \frac{10}{5}$$

Displacement = 10 (Magnitude)

$$\text{Average velocity} = \frac{10}{5} \text{ (Magnitude)}$$

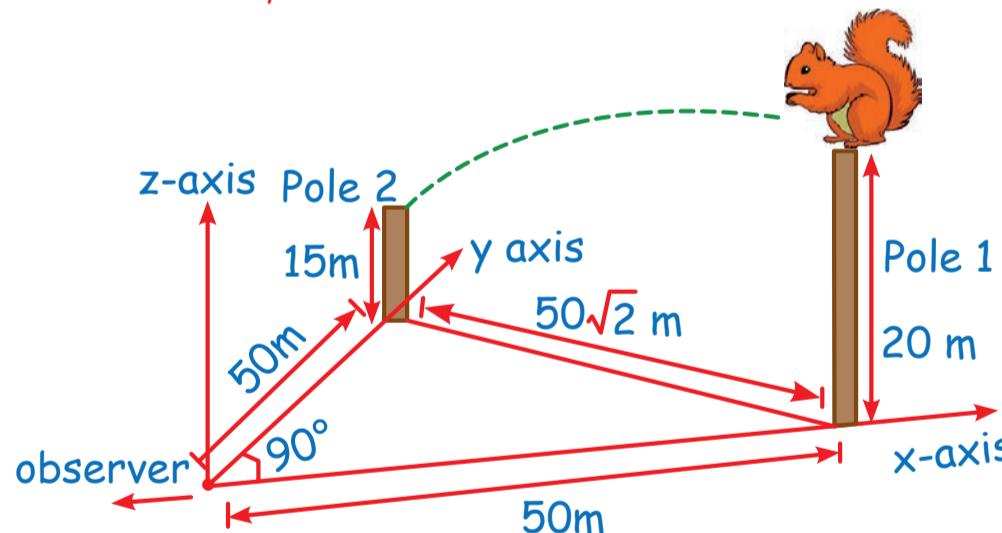

★ Agar particle ne apni direction nahi badli

★ distance = |displacement|

★ Avrg speed = |Avrg velocity|

Q. A small squirrel jumps from pole 1 to pole 2 and took 3 sec. What is average velocity vector of squirrel? If average velocity vector is expressed as $v_x \hat{i} + v_y \hat{j} + v_z \hat{k}$, express your answer as sum of magnitudes of its components $|v_x| + |v_y| + |v_z|$ in unit m/s.

Sol. Initial coordinate is $(50, 0, 20)$

Final coordinate is $(0, 50, 15)$

$$\text{Displacement} = -50\hat{i} + 50\hat{j} - 5\hat{k}$$

$$\text{Average velocity} = \frac{-50\hat{i} + 50\hat{j} - 5\hat{k}}{3}$$

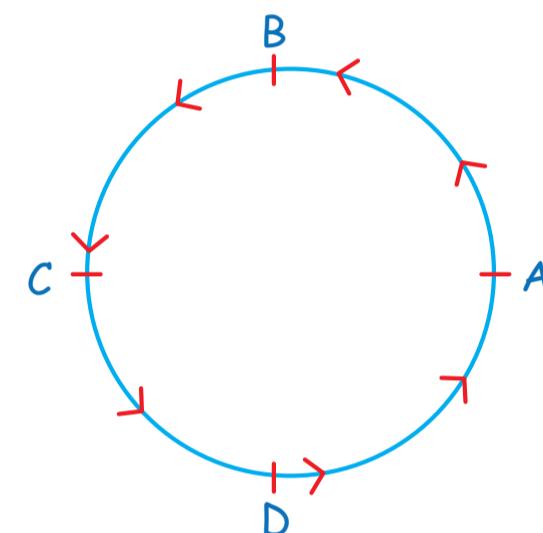

$$= -\frac{50}{3}\hat{i} + \frac{50}{3}\hat{j} - \frac{5}{3}\hat{k}$$

$$\frac{50}{3} + \frac{50}{3} + \frac{5}{3} = \frac{105}{3} = 35 \text{ m/s}$$

मुझे पता है कुछ google boys ने google पर search करके answer 105 निकाला होगा..... अब सवाल ठीक से पढ़ लिया करो

Q. A particle is performing uniform circular motion with constant speed v_1 having time period T Anticlockwise. Find avg velocity and avg speed.

Sol.

	Avrg Speed	Avrg Velocity
$A \rightarrow B$	$\frac{2\pi R / 4}{T / 4} = \frac{2\pi R}{T}$	$\frac{R\sqrt{2}}{T / 4}$
$A \rightarrow B \rightarrow C$	$\frac{\pi R}{T / 2} = \frac{2\pi R}{T}$	$\frac{2R}{T / 2}$
$A \rightarrow B \rightarrow C \rightarrow D$	$\frac{(3/4)2\pi R}{3T / 4} = \frac{2\pi R}{T}$	$\frac{R\sqrt{2}}{3T / 4}$
$A \rightarrow B \rightarrow C \rightarrow D \rightarrow A$	$\frac{2\pi R}{T}$	0

Q. A car is moving along x-axis, in 1st four hour it travel with speed 50 km/hr, in next 2 hours it move with 70 km/hr and in last part of journey it travel for 5 hour with 80 km/hr. Find avg speed.

Sol. Avrg speed = $\frac{\text{total distance}}{\text{Time}}$

$$= \frac{d_1 + d_2 + d_3}{t_1 + t_2 + t_3} = \frac{50 \times 4 + 70 \times 2 + 80 \times 5}{4 + 2 + 5}$$

$$= \frac{200 + 140 + 400}{11}$$

$$\text{Averg speed} = \frac{740}{11}$$

note: 1D motion (on x-axis)

$$\text{Average velocity} = \frac{\vec{x}_f - \vec{x}_i}{\text{time}} = \frac{\Delta \vec{x}}{\Delta t}$$

मैं average value को represent करने के कुछ symbol नीचे लिख रहा हूँ जो अक्सर use होते हैं और space बचाने के लिए हम भी use करेंगे

$$\text{Average velocity} = \langle \vec{v} \rangle$$

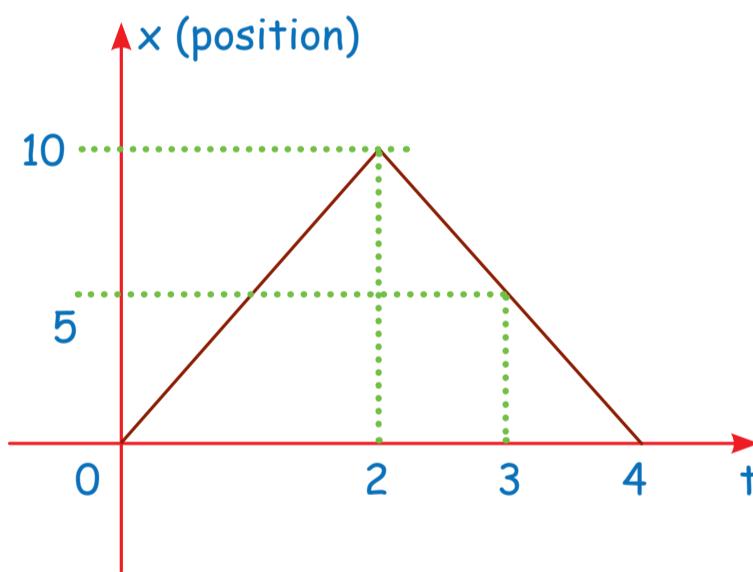

$$\text{Average speed} = \langle \text{speed} \rangle = \langle |\vec{v}| \rangle$$

$$\text{Average acc} = \langle \vec{a} \rangle$$

$$\text{Average कद्दू} = \langle \text{कद्दू} \rangle$$

Q. A particle is moving on the x-axis as show its x-coordinate unit time. Find average velocity from $t = 0$ to $t = 2$ sec, from $t = 0$ to $t = 3$ sec.

Sol. ① $t = 0 \rightarrow t = 2$ sec

$$\text{Average velocity} = \frac{x_f - x_i}{\text{time}} = \frac{10 - 0}{2} = 5$$

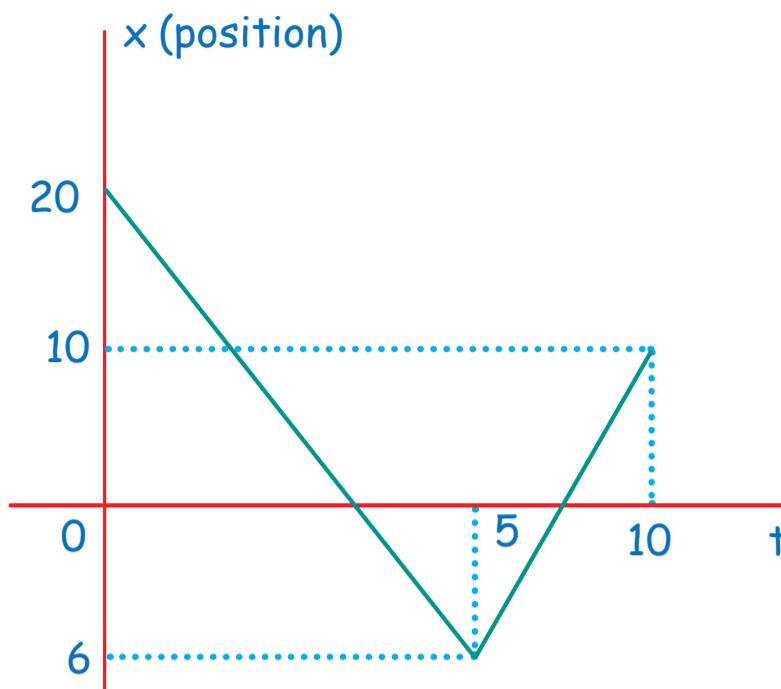

$$\text{Average speed} = \frac{10}{2} = 5 \left| \frac{10_f - 0_i}{t} \right|$$

② $t = 0 \rightarrow t = 3$

$$\text{Average velocity} = \frac{x_f - x_i}{\text{time}} = \frac{5 - 0}{3}$$

$$\text{Average speed} = \frac{10 + 5}{3}$$

Q. Find average velocity from $t = 0$ to $t = 5$ s and $t = 0$ to $t = 10$ s.

Sol. 1. $t = 0 \rightarrow t = 5$

$$\text{Average velocity} = \frac{x_f - x_i}{\text{time}} = \frac{(-6) - (+20)}{5} = -4.8$$

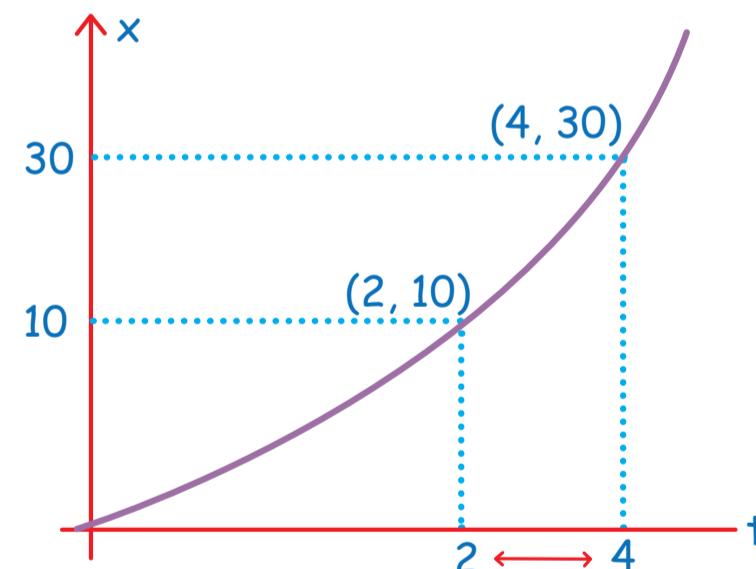

$$\text{Average speed} = \frac{20 + 6}{5} = 5.2$$

2. From $t = 0 \rightarrow t = 10$

$$\text{Average velocity} = \frac{x_f - x_i}{\text{time}} = \frac{10 - 20}{10} = -10$$

$$\text{Average speed} = \frac{20 + 6 + 6 + 10}{10} = 4.2 \text{ m/s}$$

Q. Find average velocity from $t = 2 \rightarrow t = 4$ sec

$$\text{Sol. Average velocity (mag)} = \frac{x_f - x_i}{\Delta t}$$

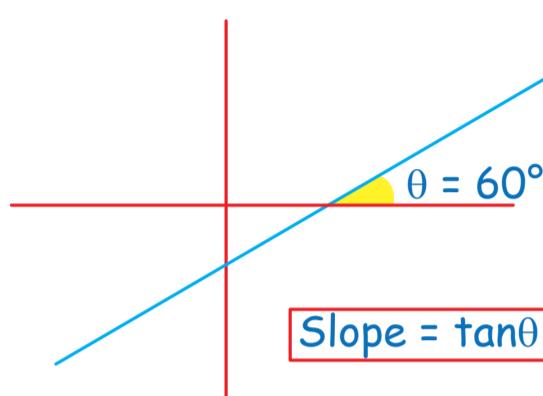

$$= \frac{20}{2} = 10$$

$$\text{Slope of line} = \frac{x_2 - x_1}{t_2 - t_1} = \frac{30 - 10}{4 - 2} = 10$$

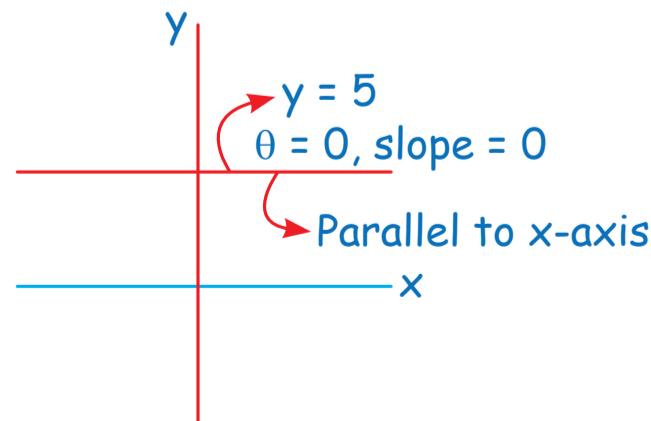

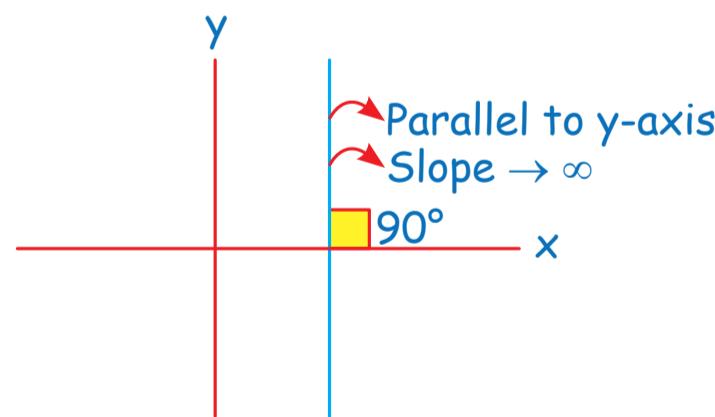

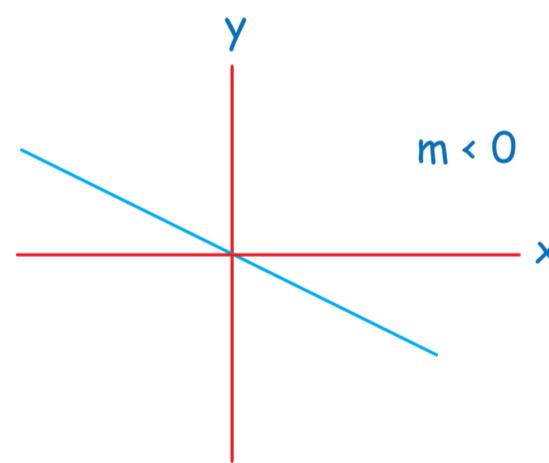

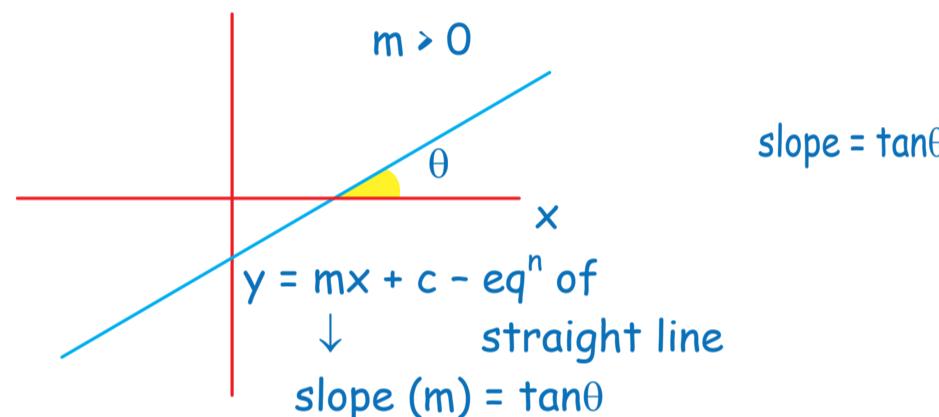

$$= \frac{20}{2} = 10$$

चलो अब थोड़ा सा काम का mathematics का revision हो जाए जिसकी हमे यहाँ बहुत जरूरत है।

SLOPE OF LINE

$$\text{slope} = \sqrt{3} = \tan 60^\circ$$

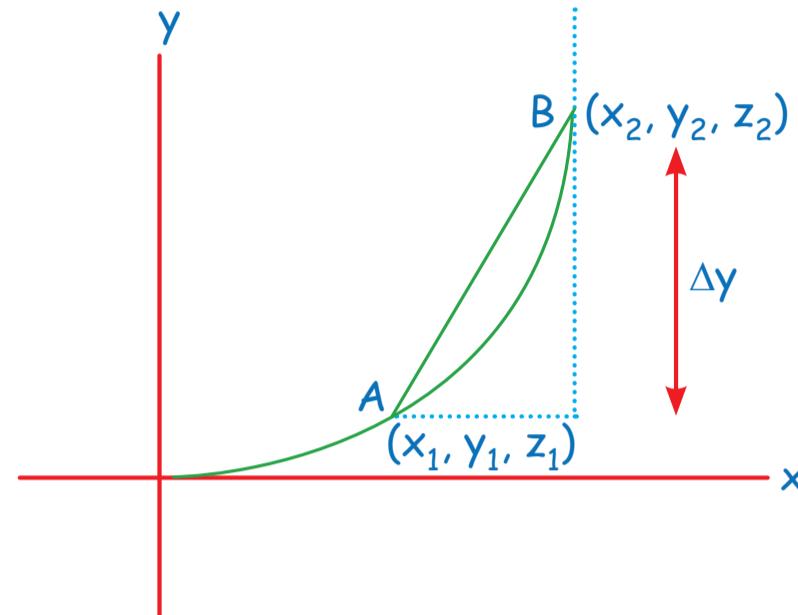

42

Slope of line join A to B

$$= \frac{y_2 - y_1}{x_2 - x_1} = \frac{\Delta y}{\Delta x} = \tan \theta$$

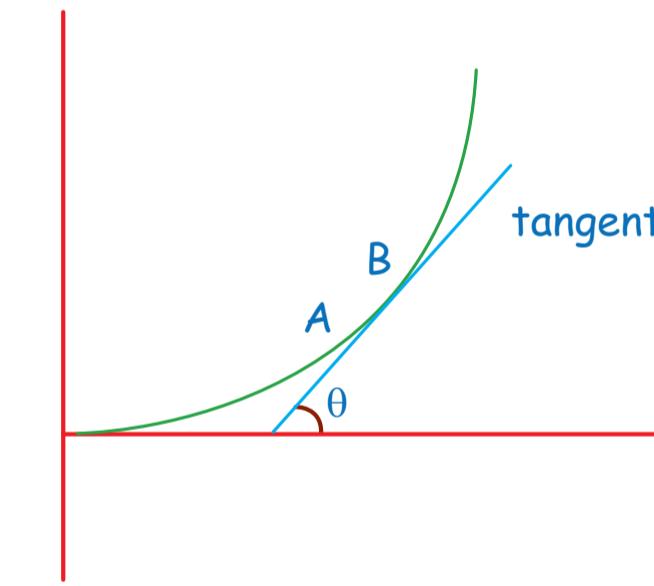

Δy = change in y

Δx = change in x

If Δy is very small $\Delta y \rightarrow 0$ ($\Delta y = dy$)

If Δx is very small $\Delta x \rightarrow 0$ ($\Delta x = dx$)

$$\text{Slope} = \frac{\Delta y}{\Delta x} = \frac{dy}{dx}$$

★ $\frac{dy}{dx}$ मतलब differentiation of y wrt x

→ और rate of change of y wrt x

→ Slope of tangent at that point

→ Ratio of very-2 small change in y to very - 2 small change in x

→ 1st derivation of y wrt x

IMP FORMULA

$\frac{d}{dx}(x^n) = nx^{n-1}$	$\frac{d}{dx}(\csc x) = -\csc x \cot x$
$\frac{d}{dx}\sin x = \cos x$	$\frac{d}{dx}(\cot x) = -\operatorname{cosec}^2 x$
$\frac{d}{dx}(\cos x) = -\sin x$	$\frac{d}{dx}e^x = e^x$
$\frac{d}{dx}(\tan x) = \sec^2 x$	$\frac{d}{dx}(\ln x) = \frac{1}{x}$
$\frac{d}{dx}(\sec x) = \sec x \tan x$	

Q. $y = x^3$

Sol. $\frac{dy}{dx} = 3x^{3-1} = 3x^2$

Q. $y = 2x^5$

Sol. $\frac{dy}{dx} = 2 \times 5x^4 = 10x^4$ Sol. $\frac{dy}{dx} = -2x^{-2-1} = \frac{-2}{x^3}$

Q. $y = x^2 + x^5$

Sol. $\frac{dy}{dx} = 2x + 5x^4$

Q. $y = x^9 + \frac{1}{x^5}$

Sol. $\frac{dy}{dx} = 9x^8 - \frac{5}{x^6}$

$\frac{dy}{dx} = 9x^8 - \frac{5}{x^6}$

differentiation of y wrt x

Q. $y = x$

Sol. $\frac{dy}{dx} = 1$

Q. $y = x^3 + \sin x$

Sol. $\frac{dy}{dx} = 3x^2 + \cos x$

Q. $y = x^7 + \tan x + 10$

Sol. $\frac{dy}{dx} = 7x^6 + \sec^2 x + 0$

Q. $y = t^3$

Sol. $\frac{dy}{dt} = 3t^2$

Q. $y = \frac{1}{x^2} = x^{-2}$

Sol. $\frac{dy}{dx} = -2x^{-2-1} = \frac{-2}{x^3}$

Q. $y = x^2 + x^5$

Sol. $\frac{dy}{dx} = 2x + 5x^4$

Q. $y = x^9 + \frac{1}{x^5}$

Sol. $\frac{dy}{dx} = 9x^8 - \frac{5}{x^6}$

$\frac{dy}{dx} = 9x^8 - \frac{5}{x^6}$

differentiation of y wrt x

Q. $y = 5$ constant

Sol. $\frac{dy}{dx} = 0$

Q. $y = 3x^3 + \sin x + \tan x$

Sol. $\frac{dy}{dx} = 9x^2 + \cos x + \sec^2 x$

Q. $y = 2x^2 + \cos x + 5$

Sol. $\frac{dy}{dx} = 4x - \sin x + 0$

Q. $y = 3x^2 + \cos x + e^x - \sin x + 10$

Sol. $\frac{dy}{dx} = 6x - \sin x + e^x - \cos x + 0$

Q. If $y = x^2 + 4x^{-1/2} - 3x^{-2}$ find $\frac{dy}{dx}$

$$\begin{aligned}\frac{dy}{dx} &= \frac{d}{dx}(x^2 + 4x^{-1/2} - 3x^{-2}) \\ &= \frac{d}{dx}(x^2) + \frac{d}{dx}(4x^{-1/2}) - \frac{d}{dx}(3x^{-2}) \\ &= \frac{d}{dx}(x^2) + 4 \frac{d}{dx}(x^{-1/2}) - 3 \frac{d}{dx}(x^{-2}) \\ &= 2x - 2x^{-3/2} + 6x^{-3}\end{aligned}$$

Q. If $3y = 4x^2 - 5$ find $\frac{dy}{dx}$

Sol. $y = \frac{4}{3}x^2 - \frac{5}{3} \Rightarrow \frac{dy}{dx} = \frac{8x}{3}$

Q. $\sqrt{y} = x - 1$, find $\frac{dy}{dx}$

Sol. $y = x^2 - 2x + 1 \Rightarrow \frac{dy}{dx} = 2x - 2$

$\frac{dy}{dx}$ को shortcut में y' भी लिखते हैं इसका मतलब है y का एक बार differentiation, उसी प्रकार अगर y का दो बार differentiation करेंगे तो उसे y'' या $\frac{d^2y}{dx^2}$ लिखते हैं जैसे

$$\begin{aligned}y &= x^3 \\ y' &= \frac{dy}{dx} = 3x^2 \\ y'' &= \frac{d^2y}{dx^2} = 6x\end{aligned}$$

Multiply

$y = u \cdot v$

$y' = uv' + vu'$

Q. $y = x^3 \cdot \sin x$

Sol. $\frac{dy}{dx} = x^3 \left(\frac{d}{dx} \sin x \right) + \sin x \left(\frac{d}{dx} x^3 \right)$

Q. $y = x^5 \tan x$

Sol. $\frac{dy}{dx} = x^5 \cdot \sec^2 x + [\tan x](5x^4)$

Q. $y = x^3 \cdot e^x$

Sol. $\frac{dy}{dx} = x^3 e^x + e^x \cdot 3x^2$

Q. $y = e^x \cdot \sin x$

Sol. $\frac{dx}{dy} = e^x \cdot \cos x + \sin x \cdot e^x$

Q. $y = x^3 e^x$

Sol. $\frac{dy}{dx} = x^3 e^x + e^x \cdot 3x^2$

Q. $y = x^4 \ln x$

Sol. $\frac{dy}{dx} = x^4 \cdot \frac{1}{x} + (\ln x)(4x^3)$

Q. $y = \sin^4 x = (\sin x)^4$

Sol. $\frac{dy}{dx} = 4(\sin x)^3 \cdot \cos x$

Q. $y = \sin(x^2 + x^3)$

Sol. $\frac{dy}{dx} = \cos(x^2 + x^3)(2x + 3x^2)$

Q. $y = \ln(\sin x^3)$

Sol. $\frac{dy}{dx} = \frac{1}{\sin x^3} \times \cos(x^3) \times [3x^2]$

Q. $y = \sin(e^x)$

Sol. $\frac{dy}{dx} = \cos(e^x) \cdot e^x$

★ $\frac{d}{dx} \sin(ax + b) = a \cos(ax + b)$

★ $\frac{d}{dx} \sin(2x + 3) = \cos(2x + 3) [2 + 0]$

★ $\frac{d}{dx} e^{2x+5} = e^{2x+5} (2 + 0)$

Q. $y = x^3$ find $\frac{dy}{dx}$ at $x = 2$

Sol. $y = x^3$

$\frac{dy}{dx} = 3x^2$

at $x = 2$, $\frac{dy}{dx} = 12$

Q. $x = t^2 - 4t + 20$ find value of $\frac{dx}{dt}, \frac{d^2x}{dt^2}$ at $t = 2$ sec

Sol. $\frac{dx}{dt} = 2t - 4 + 0 \Rightarrow$ at $t = 2$ sec, $\frac{dx}{dt} = 0$

$\frac{d^2x}{dt^2} = 2 \Rightarrow$ at $t = 2$ sec, $\frac{d^2x}{dt^2} = 2$

Chain Rule Power वाले questions

Q. $y = \sin^2 x$

$\frac{dy}{dx} = 2 \sin x \frac{d}{dx} (\sin x) = 2 \sin x \cos x$

Q. $y = \sin^2(3x + 4)$

$\frac{dy}{dx} = 2 \sin(3x + 4) \cos(3x + 4) \times 3$

ऊपर वाले chain rule के question में यह pattern पहचान

ने की कोशिश करे कि पहले बाहर वाला function का differentiation करना है फिर multiply करते हुए अंदर वाले function का differentiation करते जाना है जैसे

$$y = \sin(\text{कद्दू})$$

$$\frac{dy}{dx} = \cos(\text{कद्दू}) \times \frac{d}{dx}(\text{कद्दू})$$

Q. $y = \ln x^5$

Sol. $\frac{dy}{dx} = \frac{1}{x^5} \times 5x^4$

Q. $y = \ln x^4$

Sol. $\frac{dy}{dx} = \frac{1}{x^4} \times 4x^3$

Q. $y = \sin^3 x = (\sin x)^3$

Sol. $\frac{dy}{dx} = 3(\sin x)^2 \cdot \cos x$

Q. $y = \ln(\sin x)$

Sol. $\frac{dy}{dx} = \frac{1}{\sin x} \times \cos x$

Q. $y = \tan^2 x$

Sol. $y = (2 \tan x) \cdot \sec^2 x$

Q. $y = [\ln(3x^2)]^3$

$$\frac{dy}{dx} = 3\ln(3x^2) \times \frac{1}{3x^2} \times 6x$$

Q. $y = (x^3 + 4)^{\frac{1}{2}}$

$$\frac{dy}{dx} = \frac{1}{2}(x^2 + 4)^{-\frac{1}{2}} \times 2x$$

Very Important

1. $y = \pi x^3$

$$\frac{dy}{dx} = \pi \times 3x^2$$

3. $y = \sin x$

$$\frac{dy}{dt} = \cos x \frac{dx}{dt}$$

5. $y = \frac{4}{3} \pi x^3$

$$\frac{dy}{dx} = \frac{4}{3} \pi 3x^2$$

2. $y = x^5$

$$\frac{dy}{dt} = 5x^4 \frac{dx}{dt}$$

4. $A = \pi r^2$

$$\frac{dA}{dt} = \pi 2r \frac{dr}{dt}$$

Q. Radius of a circle changes wrt time with the rate of + 5 m/sec, find rate of change of area wrt time when radius is 10 m

Sol. $A = \pi r^2, \frac{dr}{dt} = 5$

$$\frac{dA}{dt} = \pi 2r \frac{dr}{dt} \Rightarrow \frac{dA}{dt} = \pi \times 2 \times 10 \times 5$$

$\frac{dy}{dx} \rightarrow$ Rate of change of y wrt x

$\frac{dA}{dt} \rightarrow$ Rate of change of Area with time

$\frac{dr}{dt} \rightarrow$ Rate of change of radius wrt time

Q. If radius of a sphere is increasing at the rate of 10 m/sec at what rate volume of sphere will change, when radius is 3 m

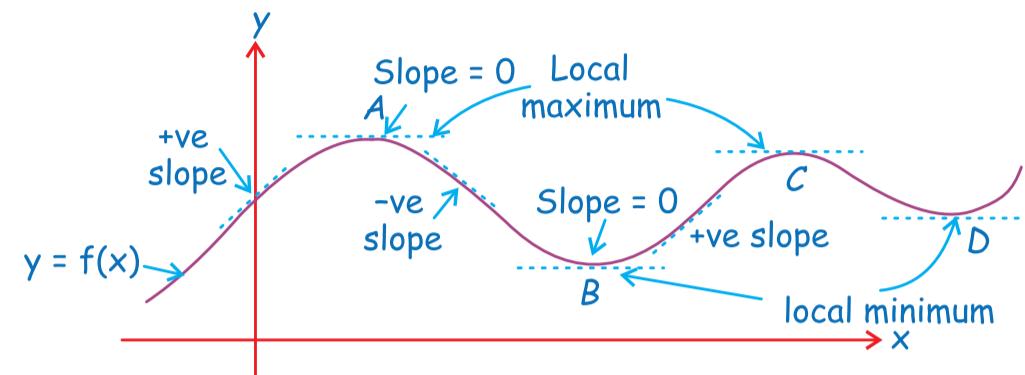

Sol. $V = \frac{4}{3} \pi r^3 - \frac{dv}{dt} = \frac{4}{3} \pi 3r^2 \frac{dr}{dt}$

$$\frac{dv}{dt} = \frac{4}{3} \pi 3(3)^2 \times 10 = 360\pi$$

MAXIMA AND MINIMA

Finding maxima and minima of a function using derivatives:-

A maximum is a high point and minimum is low point of a function (see figure)

In a smoothly changing function a maximum or a minimum is always where function flattens out or where slope of tangent line is zero. We know slope = $\frac{dy}{dx}$. So a function reaches its maximum or minimum value when $\frac{dy}{dx} = 0$.

In the neighbourhood of maximum (point A), slope changes from positive to zero at point A and then becomes negative as x increases which means

$$\frac{d}{dx}(\text{slope}) < 0 \Rightarrow \frac{d}{dx}\left(\frac{dy}{dx}\right) = \frac{d^2y}{dx^2} < 0$$

In the neighbourhood of minimum (point B), slope changes from negative to zero and then becomes positive as x increases which means

$$\frac{d}{dx}(\text{slope}) > 0 \Rightarrow \frac{d}{dx}\left(\frac{dy}{dx}\right) = \frac{d^2y}{dx^2} > 0$$

SECOND DERIVATIVE TEST

When a function's slope $\left(\frac{dy}{dx}\right) = 0$ at a point and its second derivative at that point is

- (i) less than zero, it is a local maximum.
- (ii) greater than zero, it is a local minimum.

★ Jab भी कभी किसी function की max या min value chahiye होगी हम उसे diff करके Zero कर देंगे.

★ For point of maxima $\frac{dy}{dx} = 0, \frac{d^2y}{dx^2} < 0$

★ For point of minima $\frac{dy}{dx} = 0, \frac{d^2y}{dx^2} > 0$

Q. $y = x^2 - 4x + 20$

Find $y_{\min} = ?$

Sol. $\frac{dy}{dx} = 2x - 4 = 0 \Rightarrow x = 2$

$$\frac{d^2y}{dx^2} = 2 - 0 = 2 > 0$$

$\frac{d^2y}{dx^2} > 0$ hence at $x = 2$, y is min

So, $y_{\min} = 2^2 - 4 \times 2 + 20 = 16$

Q. $y = \sqrt{3} \sin \theta + \cos \theta$ Find y_{\max}

Sol. $\frac{dy}{d\theta} = \sqrt{3} \cos \theta - \sin \theta = 0$

$\sqrt{3} \cos \theta = \sin \theta$

$\theta^\circ = 60^\circ$

$$\frac{d^2y}{d\theta^2} = -\sqrt{3} \sin \theta - \cos \theta$$

at $\theta = 60^\circ$

$$\frac{d^2y}{d\theta^2} = \frac{-3}{2} - \frac{1}{2} < 0$$

So y is max.

$y_{\max} = \sqrt{3} \sin 60^\circ + \cos 60^\circ$

$\sqrt{3} (\sqrt{3}/2) + 1/2 = 2$

$y = a \sin \theta + b \cos \theta$

$$y_{\max} = \sqrt{a^2 + b^2}$$

$$y_{\max} = \sqrt{3+1} = 2$$

Q. What is the minimum value of y for the curve $y = -8x^2 + x^4$.

Sol. $y = -8x^2 + x^4$

$$\frac{dy}{dx} = -16x + 4x^3 = -x(16 - 4x^2)$$

The function will have a maximum or minimum

value when $\frac{dy}{dx} = 0$

$\Rightarrow x(16 - 4x^2) = 0$

$\Rightarrow x = 0$ or $x = \pm 2$

Now

$$\frac{d^2y}{dx^2} = -16 + 12x^2$$

At $x = 0$, $\frac{d^2y}{dx^2} = -16$ (maximum)

At $x = \pm 2$, $\frac{d^2y}{dx^2} = -16 + 48 = +32$ (minimum)

So function has minimum value at $x = \pm 2$

$y_{\min} = -8 \times 4 + 16 = -16$

Q. A ball is thrown vertically upward in the air. Its height y at any time t is given by $y = 10t - 5t^2$ where y is in meters and t is in seconds. What is the maximum height attained by the ball?

Sol. $y = 10t - 5t^2$

$$\frac{dy}{dt} = 10 - 10t = 0$$

$\Rightarrow t = 1$ sec

$$\frac{d^2y}{dt^2} = -10$$
 (maximum)

ball attains maximum height at $t = 1$ s

$y_{\max} = 10 \times 1 - 5 \times 1^2 = 5$ m.

★ Inst. velocity = $\vec{v} = \frac{\vec{dr}}{dt}$

★ If particle moving on x -axis

$$\text{Inst. velocity} = \vec{v}_x = \frac{dx}{dt} \hat{i}$$

सीधी बात x को time के respect में differentiate करेंगे तो velocity आएगी।

Q. A particle is moving on x -axis such that its x -coordinate w.r.t time change as $x = t^2 - 6t + 10$

(a) Find velocity at $t = 0, t = 3, t = 6$ sec, = Inst velocity

Sol. $v = \frac{dx}{dt} = 2t - 6$

(now put the value of t)

$t = 0, v = -6$

$t = 3, v = 0$

$t = 6, v = +6$

★ किसी time पर v मतलब instantaneous velocity

★ किसी time पर velocity का magnitude ही उस time पर instantaneous speed है

(b) Find avg velocity between $t = 0 \rightarrow t = 3$

Sol. Average velocity = $\frac{x_f - x_i}{t_f - t_i}$

$t = 0, x_i = 0 - 0 + 10 = 10$

$t = 3, x_f = 3^2 - 6 \times 3 + 10 = 1$

Average velocity = $\frac{1-10}{3} = -3\hat{i}$

Definition carefully याद रखनी है, avg velocity के लिए x को differentiate मत कर देना।

Avg velocity निकालने के लिए बस ये देखो x_i और x_f क्या है।

Q. $x = t^2 - 2t + 10$. Find avg velocity and avg speed from $t = 0$ to $t = 3$ sec

Sol. At $t = 0$, $x = 10$

At $t = 3$, $x = 9 - 6 + 10 = 13$

$$\text{Avg velocity} = \frac{13 - 10}{3} = 1$$

Avg speed = 1 (क्यों भाई तूने यही किया ना)

अब गलत है Avg speed हमेशा avg velocity के बराबर नहीं होती definition याद करो क्या थी।

SKC

Avg speed के लिए हमे रास्ता पता होना जरूरी है। So, सबसे पहले initial और final position निकालो और velocity zero करके turning point निकालो, फिर रास्ता बना कर देखो particle कितना चला है।

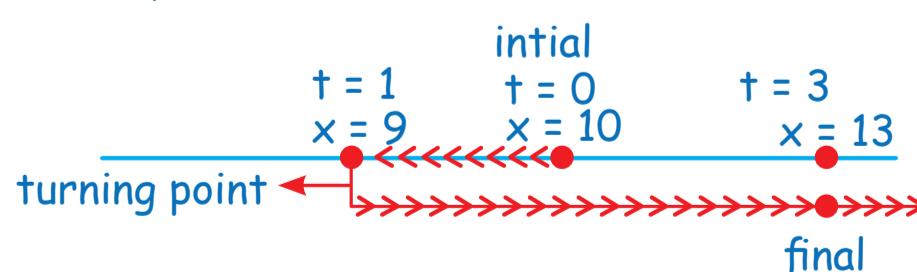

At $t = 0$, $x = 10$

At $t = 3$, $x = 13$ now find turning point

$$v = 2t - 2 = 0$$

$t = 1$ (देखो इस time पर particle में अपनी direction change की है पता लगाओ $t = 1$ पर particle कहाँ है)

$$t = 1, x = 1^2 - 2 \times 1 + 10 = 9$$

$$\text{Average speed} = \frac{1+4}{3} = \frac{5}{3}$$

Better understanding के लिए नीचे वाले ques और solve करो

Q. $x = 2t^2 - 4t + 5$ from $t = 0 \rightarrow t = 2$ Find Average speed

Sol. $t = 0, x_i = 5$

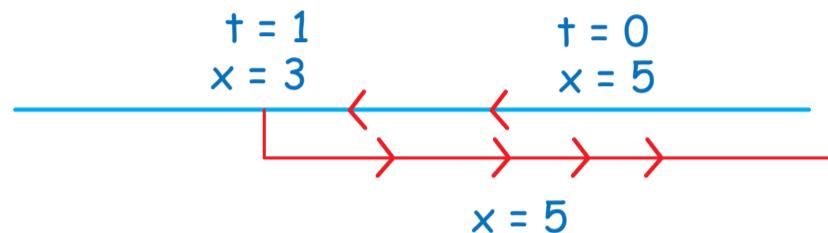

$t = 2, x_f = 5$

$$v = 4t - 4 = 0 \text{ (for turning point)}$$

$$4t = 4$$

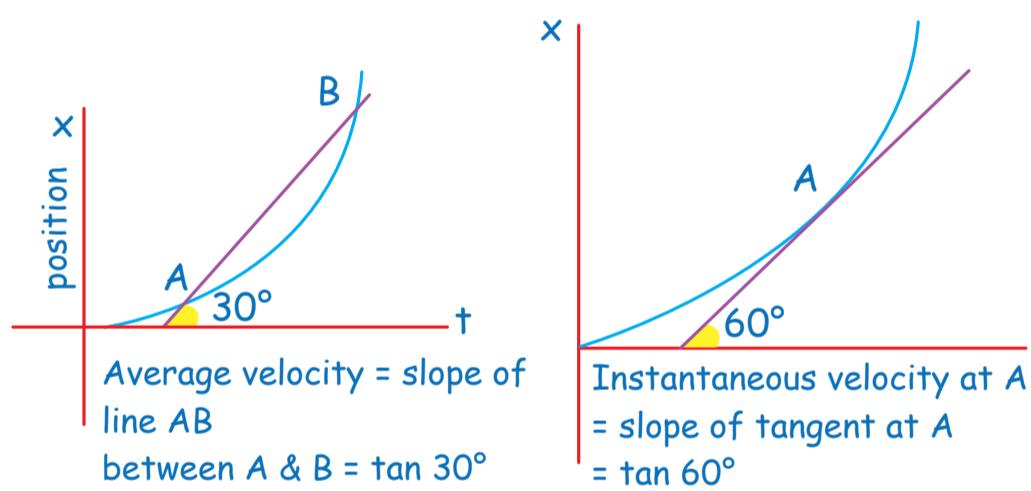

$$t = 1$$

At $t = 1, x = 2 - 4 + 5 = 3$

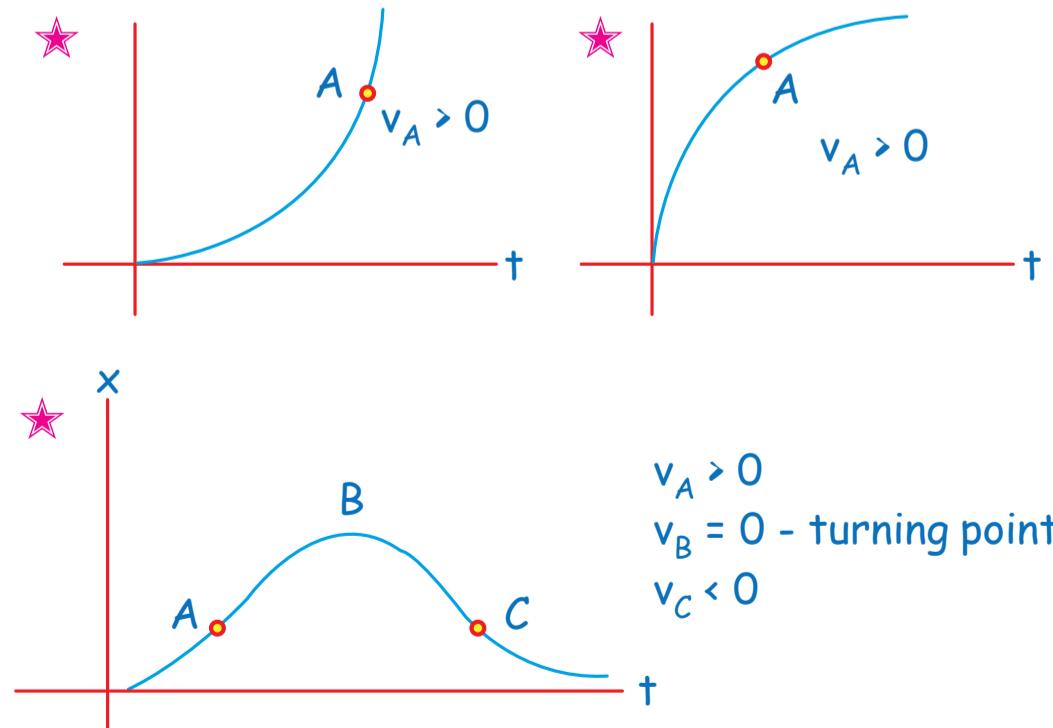

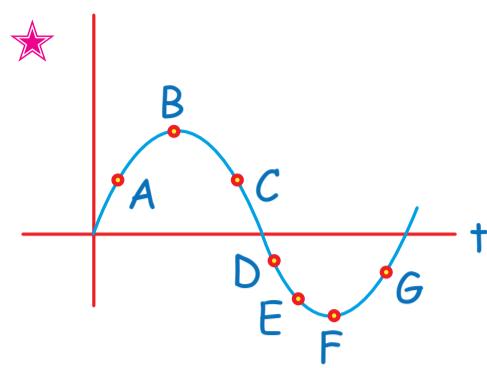

$$\text{Average speed} = \frac{2+2}{4} = 1$$

GRAPHS

x-t graph में किसी point पर tangent का slope उस point पर velocity देगा..... इसे मत भूलना

$$\begin{aligned}v_A &> 0 \\v_B &= 0 \\v_C &< 0 \\v_D &< 0 \\v_E &< 0 \\v_F &= 0 \\v_G &> 0\end{aligned}$$

ACCELERATION

★ Inst accelⁿ → Rate of change of velocity $\vec{a} = \frac{d\vec{v}}{dt}$

If $\vec{V} \rightarrow$ constant

$$a = 0$$

Agar velocity badli to acceleration hai.

★ Average acceleration → $\frac{\text{change in velocity}}{\text{time}}$

$$= \frac{\vec{\Delta v}}{\Delta t} = \frac{\vec{v}_f - \vec{v}_i}{t_f - t_i}$$

Q. A particle is moving on x-axis such that its velocity is given at $V = t^2 + 4t + 10$.

Find acc at $t = 3$ sec

avg acc from $t = 0 \rightarrow t = 3$

$$\text{Sol. } \vec{a} = \frac{dv}{dt} = 2t + 4$$

$$\text{At } t = 3 \quad a = 2 \times 3 + 4 = 10$$

$$\text{Average acc} = \frac{V_f - V_i}{\text{time}}$$

$$t = 3, V_f = 9 + 12 + 10 = 31$$

$$t = 0, V_i = 10$$

$$\text{Average acc} = \frac{31 - 10}{3 - 0} = 7$$

Q. $x = t^3 + 2t^2 + 5t$ Find velocity & acc at $t = 2$ sec

$$\text{Sol. } v = \frac{dx}{dt} = 3t^2 + 4t + 5$$

$$a = \frac{dv}{dt} = 6t + 4$$

$$t = 2, a = 12 + 4 = 16$$

$$t = 2, v = 12 + 8 + 5 = 25$$

काम का डब्बा

अब तक का final result ये है की

→ x-t graph में किसी point पर tangent का slope उस point पर velocity देगा।

→ v-t graph में किसी point पर tangent का slope उस point पर acc देगा।

→ $\vec{v}, \vec{a} \Rightarrow$ same sign \Rightarrow speed up

→ $\vec{v}, \vec{a} \Rightarrow$ opposite sign \Rightarrow speed down.

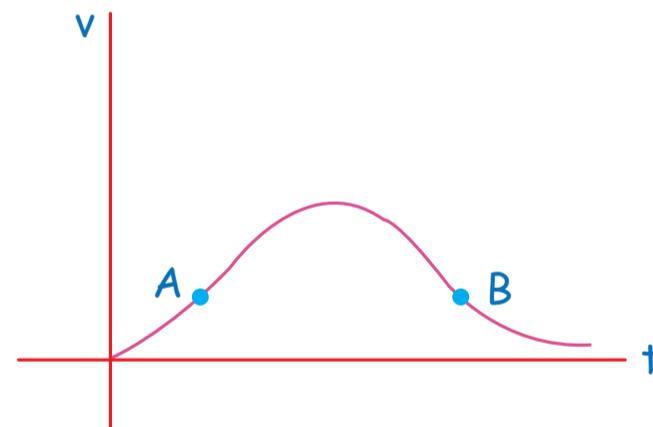

→ Average velocity = $\frac{\text{total displacement}}{\text{total time}}$

→ Average speed = $\frac{\text{total distance}}{\text{total time}}$

→ Average acc = $\frac{\text{change in velocity}}{\text{total time}} = \frac{\vec{v}_f - \vec{v}_i}{t}$

→ ($a - t$) graph ka slope कददू देगा।

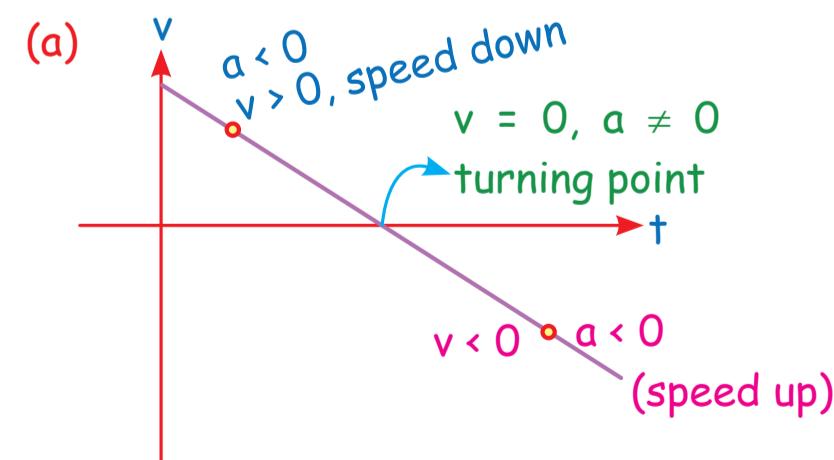

Q. Check if particle is slowing down or speed up at points A & B?

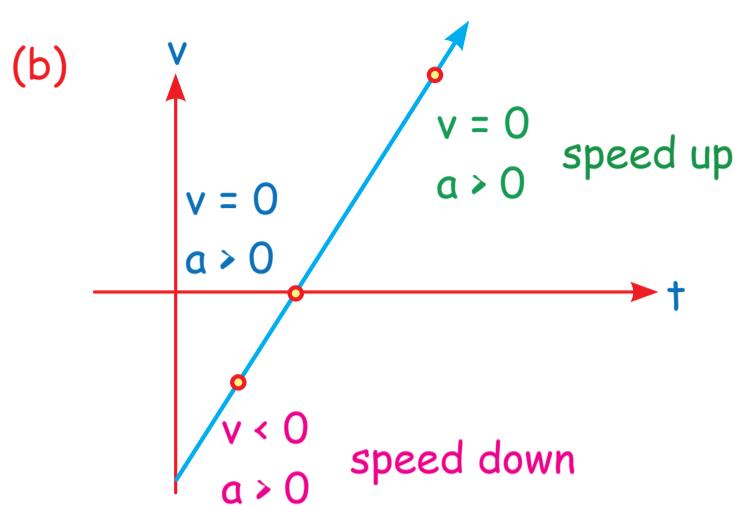

Sol. $v_A > 0, a_A > 0 \Rightarrow$ speed up

$v_B > 0, a_B < 0 \Rightarrow$ speed down

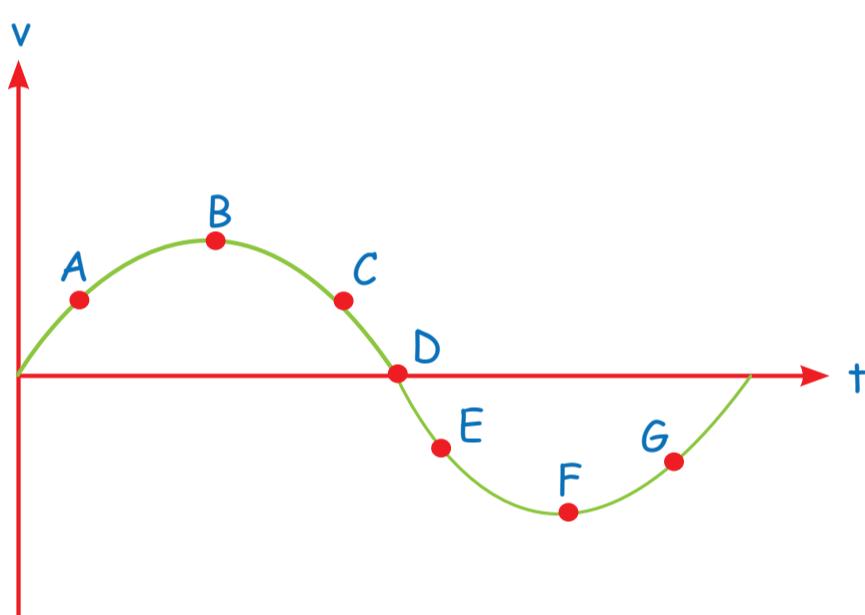

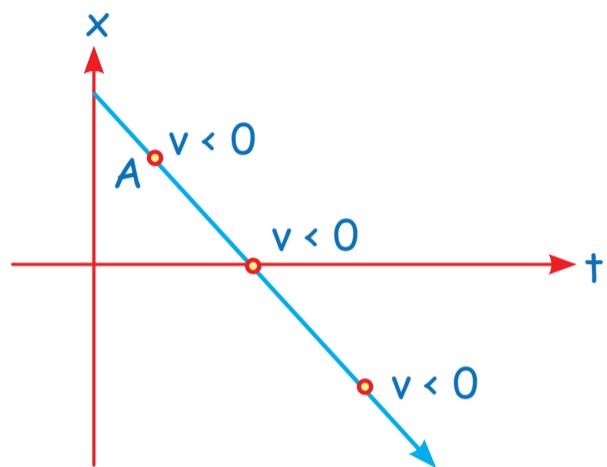

Q. Where is particle slowing down?

At turning point $\Rightarrow v = 0$ & v changes its sign at this point.

Q. Is velocity +ve or -ve in the x-t graph?

A $\Rightarrow v > 0, a > 0$, speed up

B $\Rightarrow v > 0, a = 0$

C $\Rightarrow v > 0, a < 0$, speed down

D $\Rightarrow v = 0, a < 0$

E $\Rightarrow v < 0, a < 0$, speed up

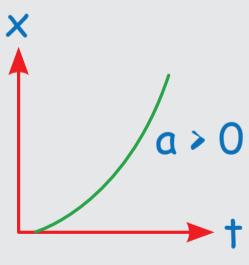

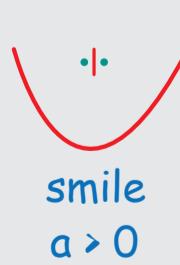

F $\Rightarrow v < 0, a = 0$

G $\Rightarrow v < 0, a > 0$, speed down

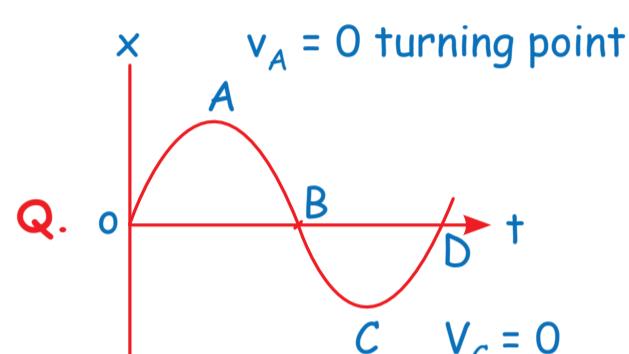

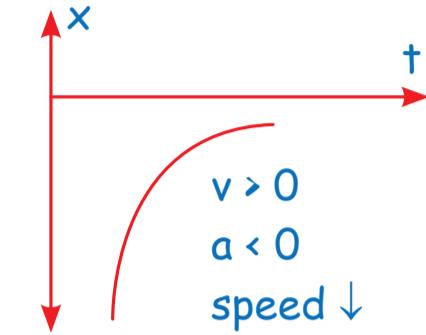

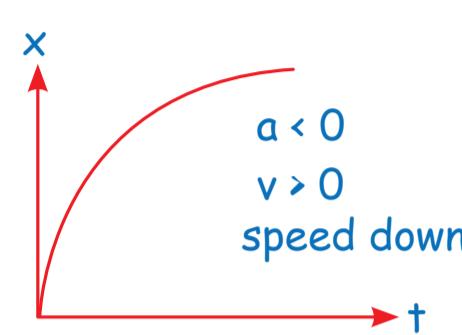

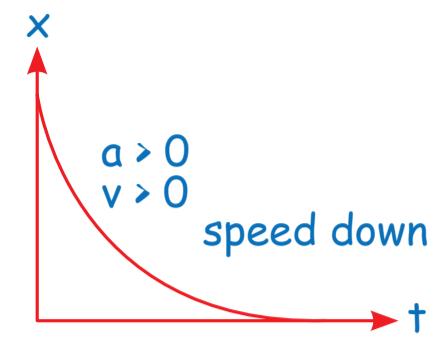

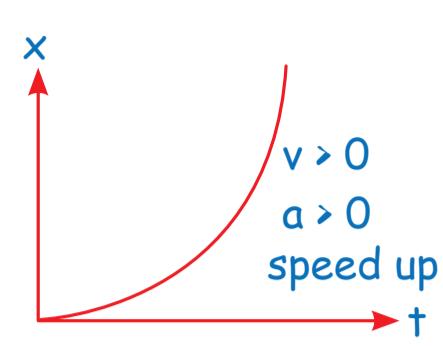

1. पहले ये देखो given क्या है पूछा क्या है ?

2. x - y axis mai kya given hai.

x - t graph se direct acc ka sign pata karna ho.

Only for x - t graph

	v	a	Speed ↓↑
0 \rightarrow A	+	-	Speed ↓
A \rightarrow B	-	-	Speed up
B \rightarrow C	-	+	Speed ↓
C \rightarrow D	+	+	Speed ↑

INTEGRATION (MATHS)

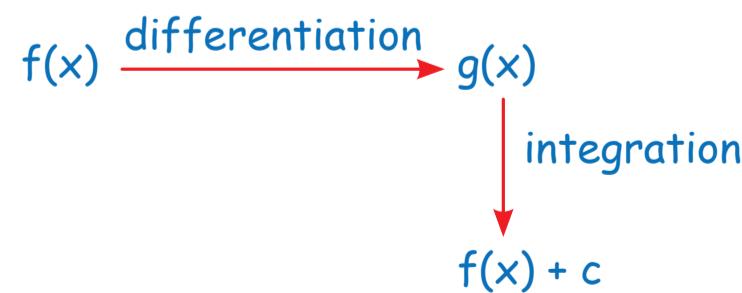

Reverse of differentiation

$\frac{d}{dx} f(x) \Rightarrow$ differentiation of $f(x)$ wrt x

$\frac{dy}{dx} \Rightarrow$ differentiation of y wrt x

$\int y dx \Rightarrow$ integration of y wrt x

$\frac{d}{dx} f(x) = f'(x) \Rightarrow \int f'(x) dx = f(x) + c$, where c is constant of integration.

Indefinite Integration

$\int x^n dx$ = Integration of x^n wrt x

$$\int x^n dx = \frac{x^{n+1}}{n+1} + C$$

Physics मे सबसे ज्यादा यही formula use होगा

Examples:

$$1. \int x^4 dx = \frac{x^{4+1}}{4+1} + C = \frac{x^5}{5} + C$$

$$2. \int x^7 dx = \frac{x^{7+1}}{7+1} + C = \frac{x^8}{8} + C$$

$$3. \int (x^2 + x^3) dx = \frac{x^3}{3} + \frac{x^4}{4} + C$$

$$4. \int 5x^4 dx = 5 \int x^4 dx$$

$$= 5 \cdot \frac{x^5}{5} + C = x^5 + C$$

$$5. \int (3x^2 + 7x^6) dx$$

$$\frac{3x^3}{3} + \frac{7x^7}{7} + C \Rightarrow x^3 + x^7 + C$$

$$6. \int x^{-3} dx = \frac{x^{-3+1}}{-3+1} + C$$

$$= \frac{-1}{2x^2} + C$$

$$7. \int \left(\frac{1}{x^9} + \frac{1}{x^{10}} \right) dx$$

$$= \int (x^{-9} + x^{-10}) dx$$

$$= \frac{x^{-9+1}}{-9+1} + \frac{x^{-10+1}}{-10+1} + C = -\frac{x^{-8}}{8} - \frac{x^{-9}}{9} + C$$

$$8. \int dx = \int 1 dx$$

$$= \int x^0 dx$$

$$= \frac{x^{0+1}}{0+1} + C = x + C$$

$$9. \int 5 dx = 5 \int dx = 5x + C$$

$$10. \int (2t + 7t^6 + 10) dt = \frac{2t^2}{2} + \frac{7t^7}{7} + 10t + C$$

$$= t^2 + t^7 + 10t + C$$

FORMULA

$$\star f(x^n dx) = \frac{x^{n+1}}{n+1} + C$$

$$\star \int e^x dx = e^x + C$$

$$\star \int \frac{1}{x} dx = \ln x + C$$

$$\star \int \sin x dx = -\cos x + C$$

$$\star \int \cos x dx = \sin x + C$$

$$\star \int \frac{1}{ax+b} dx = \frac{1}{a} \ln(ax+b) + C$$

$$\star \int \sin(ax+b) dx = -\frac{1}{a} \cos(ax+b) + C$$

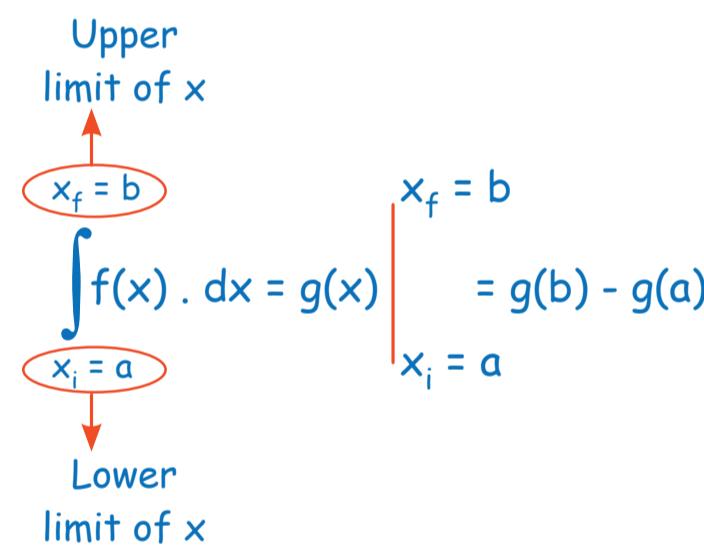

$$\star \int \cos(ax+b) dx = \frac{1}{a} \sin(ax+b) + C$$

$$\star \int 2 \cos(2x+3) dx = \sin(2x+3)$$

$$\star \int \cos(2x+3) dx = \frac{1}{2} \sin(2x+3) + C$$

$$\star \int \frac{1}{4x+5} dx = \frac{1}{4} \ln(4x+5) + C$$

Definite Integration

Ex (1):

$$\int_0^3 x^2 dx = \frac{x^3}{3} \Big|_0^3 = \left(\frac{3^3}{3} \right) - \left(\frac{0^3}{3} \right) = 9 \text{ Ans}$$

Ex (2):

$$\int_2^3 4x^3 dx = 4 \frac{x^4}{4} \Big|_2^3 = x^4 \Big|_2^3 = 3^4 - 2^4 = 81 - 16 = 65 \text{ Ans}$$

Ex (3):

$$\int_0^{\pi/2} \cos x dx = \sin x \Big|_0^{\pi/2} = \left(\sin \frac{\pi}{2} \right) - \sin 0 = 1 - 0 = 1$$

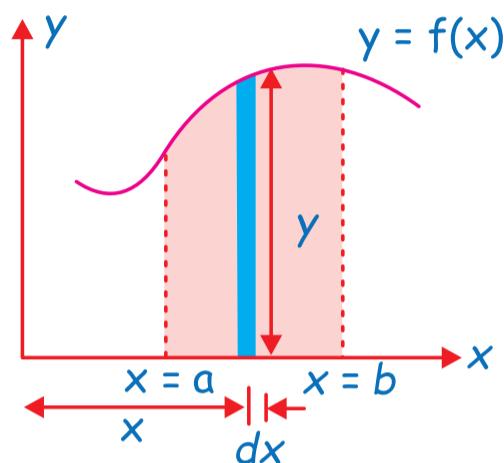

Ex (4):

$$\int_2^3 e^x dx = e^x \Big|_2^3 = e^3 - e^2$$

$$Q. \int_0^1 (3x^2 + 2x) dx = 3 \left[\frac{x^3}{3} + 2 \frac{x^2}{2} \right]_0^1 \\ = (x^3 + x^2) \Big|_0^1 = (1^3 + 1^2) - (0^3 + 0^2) = 2 \text{ Ans}$$

APPLICATION OF INTEGRATION

★ Area under the curve :

Area of small element = $y dx = f(x) dx$

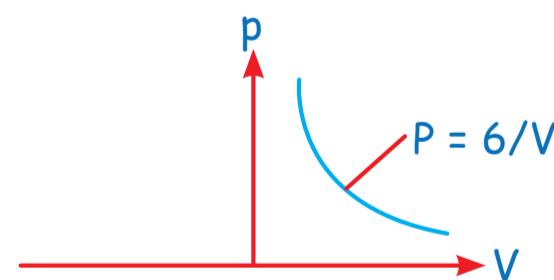

If we sum up all areas between $x = a$ and $x = b$ then

$$\int_a^b f(x) dx = \text{shaded area between curve and } x\text{-axis.}$$

★ Average value

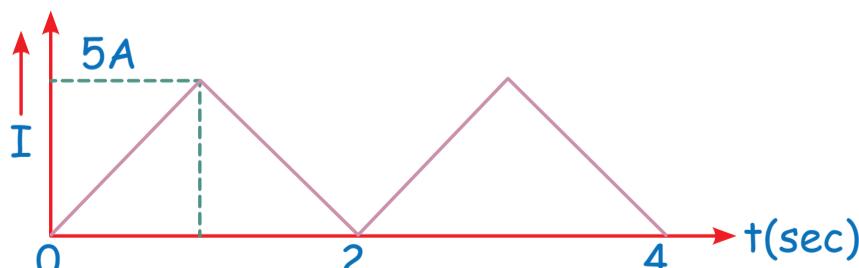

$$\text{if } y = f(x) \text{ then } \bar{y} \text{ or } y_{\text{average}} = \frac{\int_{x=a}^{x=b} f(x) dx}{b-a} \\ = \frac{\text{Area under the curve}}{\text{interval}}$$

Q. A gas expands its volume from V to $3V$ as shown in figure. Calculate the work in this process if $W = \int pdv$.

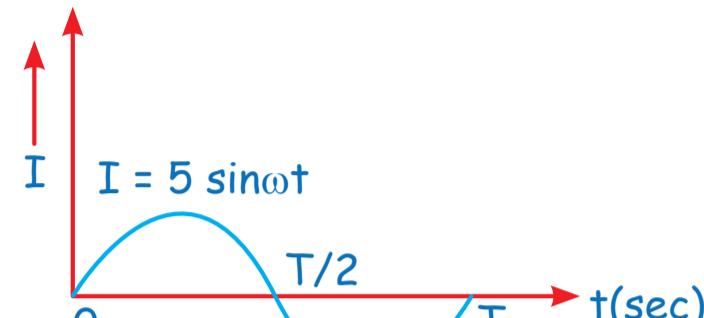

$$\text{Sol. } W = \int_V^{3V} pdv \Rightarrow \int_V^{3V} \frac{6}{v} dv = [6 \ln v]_V^{3V} = 6 \ln 3$$

Q. Calculate average value of current from $t = 0$ to $t = 4$ seconds.

$$\text{Sol. } I_{\text{average}} = \frac{\int_a^b I dt}{\int_a^b dt} = \frac{\text{total area}}{\text{total time}} = \frac{5 \times 2}{4} = 2.5 \text{ amp}$$

Q. Calculate average value of current from $t = 0$ to $t = T$ seconds ($T = 2\pi/\omega$).

$$\text{Sol. } I_{\text{average}} = \frac{\int_0^T 5 \sin \omega t dt}{\int_0^T dt} = \frac{5}{\omega T} [-\cos \omega t]_0^T \\ = -\frac{5}{\omega T} [\cos \omega T - \cos 0] = 0 \quad \left[\omega = \frac{2\pi}{T} \right]$$

★ For any moving object, the average speed can never be zero or negative, as total distance covered is always +ve.

★ If a particle travels distances s_1, s_2, s_3, \dots , etc., at different speeds v_1, v_2, v_3, \dots , etc., respectively, then

$$v_{\text{av}} = \frac{\Delta s}{\Delta t} = \frac{\sum s_i}{\sum (s_i/v_i)}$$

If $s_1 = s_2 = \dots = s_n = s$,

$$\text{Then } \frac{1}{v_{\text{av}}} = \frac{1}{n} \left[\frac{1}{v_1} + \frac{1}{v_2} + \dots \right] = \frac{1}{n} \sum \frac{1}{v_i}$$

Special case: If a particle moves a distance at speed v_1 and comes back to initial position with speed v_2 , then

$$v_{\text{av}} = \frac{2v_1 v_2}{v_1 + v_2}$$

★ If a particle travels at speeds v_1, v_2, \dots , etc., for time intervals t_1, t_2, \dots , then

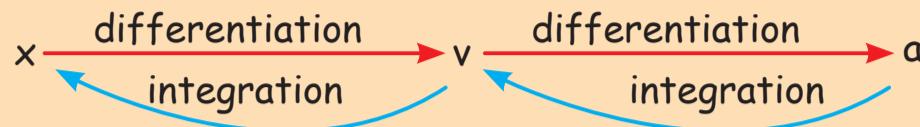

$$v_{\text{av}} = \frac{\Delta s}{\Delta t} = \frac{v_1 t_1 + v_2 t_2 + \dots + v_n t_n}{t_1 + t_2 + \dots + t_n} = \frac{\sum v_i t_i}{\sum t_i}$$

Special case: If a particle moves for two equal intervals of time at different speeds, then

$$v_{\text{av}} = \frac{v_1 + v_2}{2}$$

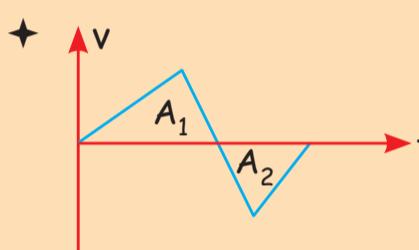

काम का डब्बा

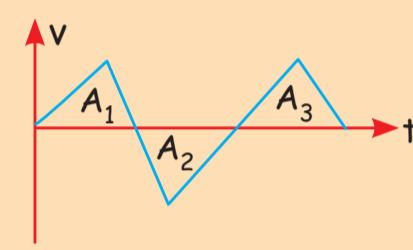

$\int y \cdot dx = \text{Area under curve}$
curve और x-axis के बीच का Area

- ★ a-t graph का area change in velocity देता है।
- ★ v-t graph का area change in position देता है बोले तो
- v-t graph का area displacement देता है

$$\text{Displacement} = A_1 - A_2 \\ \text{Distance} = A_1 + A_2$$

$$\text{Displacement} = A_1 - A_2 + A_3 \\ \text{Distance} = A_1 + A_2 + A_3$$

- ★ (x - t) graph ka slope $\Rightarrow v$
- ★ (v - t) graph ka slope $\Rightarrow a$
- ★ $v = \frac{dx}{dt}, a = \frac{dv}{dt}$
- ★ Displacement $= \int v dt = \text{Area}$
- ★ change in velocity $= \int a dt$
- ★ St line \rightarrow slope \rightarrow const
- ★ (v - t) is st. line $\rightarrow a = \text{constant}$
- ★ If (x-t) is straight line $\rightarrow v = \text{constant}$ and $a = 0$.
- ★ If $a = 0 \rightarrow v = \text{constant} \rightarrow (x-t)$ straight line
- ★ If $a = \text{const} \rightarrow (v-t)$ straightline $\rightarrow (x-t)$ parabola
- ★ If a body moves with uniform acceleration and velocity changes from u to v in a time interval, then average velocity $= \frac{v+u}{2}$.
- ★ If a body moving with uniform acceleration has velocities u and v at two points in its path, then the velocity at the midpoint of given two points $= \sqrt{\frac{u^2 + v^2}{2}}$.

- Q. At $t = 0$, particle is at $x = 10$ particle is moving such that its velocity vs time relation is given as $V = 3t^2 + 2t$. Find location of particle, $t = 1$ and $x = f(t)$

Sol. $x = \int v dt = \int (3t^2 + 2t) dt = t^3 + t^2 + c$

at $t = 0, x = 10$ (put the value)

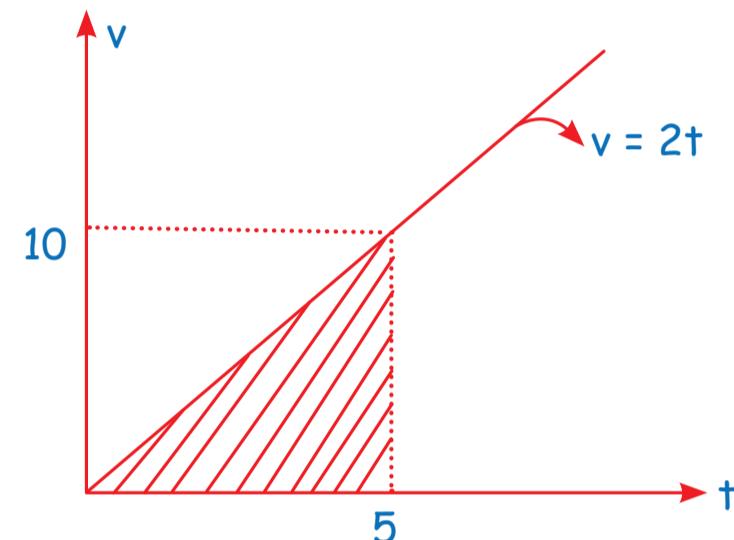

$$x = t^3 + t^2 + c$$

$$10 = 0 + 0 + c \Rightarrow c = 10$$

$$x = t^3 + t^2 + 10 \text{ (now you can find } x \text{ for any } t\text{)}$$

- Q. A particle is moving along x-axis. Its velocity vs time relation is given as $v = 2t$. Find displacement from $t = 0, t = 5$

Sol.

$$\text{Area} = \frac{1}{2} \times 5 \times 10 = 25 = \text{displacement}$$

- Q. What is the acceleration for each graph segment in figure? Describe the motion of the object over the total time interval. Also calculate displacement.

Sol. Segment OA; $a = \frac{8-0}{4-0} = 2 \text{ m/s}^2$

Segment AB; graph horizontal i.e., slope zero i.e., $a = 0$

Segment BC; $a = \frac{0-8}{18-10} = -1 \text{ m/s}^2$

The graph is trapezium. Its area between $t = 0$ to $t = 18s$ is displacement.

$$\text{Area of v-t graph} = \text{displacement} = \frac{1}{2} (18 + 6) \times 8 = 96 \text{ m}$$

Particle accelerates uniformly for first 4 sec., then moves with uniform velocity for next 6 sec. and then retards uniformly to come to rest in next 8 sec.

- Q.** A particle starts from rest, accelerates at 2 m/s^2 for 10 s & then goes at constant velocity for 30s and then deaccelerate at 4 m/s^2 till it stops. What is the distance travelled by it.

Sol.

$$\text{Area} = \frac{1}{2} \times (30 + 45) \times 20 = 750$$

$$\left. \begin{array}{l} v = u + at \\ s = ut + \frac{1}{2}at^2 \\ v^2 = u^2 + 2as \end{array} \right\} \begin{array}{l} u = \text{initial velocity} \\ a = \text{cons} \\ v = \text{final velocity} \\ a = \text{acc} \\ s = \text{displacement} \end{array}$$

भाई ये eqn तभी लगाना
जब a constant हो

- Q.** A particle start motion having initial velocity 20 m/s and it move with const acc of 10 m/s^2

1. Find velocity at $t = 4 \text{ sec}$
2. Find displacement of particle from $t = 0$ to $t = 4 \text{ sec}$
3. Find displacement in 4th sec

Sol. 1. $t = 4, v = u + at$

$$= 20 + 10 \times 4$$

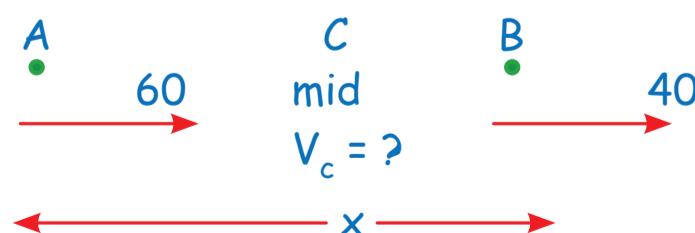

$$v = 60$$

2. $s = ut + \frac{1}{2}at^2$

$$= 20 \times 4 + \frac{1}{2} \times 10 \times 4^2 = 160$$

- Q.** A truck travelling with uniform acceleration crosses two points A & B with velocities 60 m/s & 40 m/s respectively. The speed of the body at the midpoint of A & B is nearest to.

Sol.

$$\textcircled{A \rightarrow B} \quad 40^2 = 60^2 + 2ax \Rightarrow 2ax = -2000 \quad (\text{i})$$

$$\textcircled{A \rightarrow C} \quad V_C^2 = 60^2 + 2a \times 2 \quad (\text{ii})$$

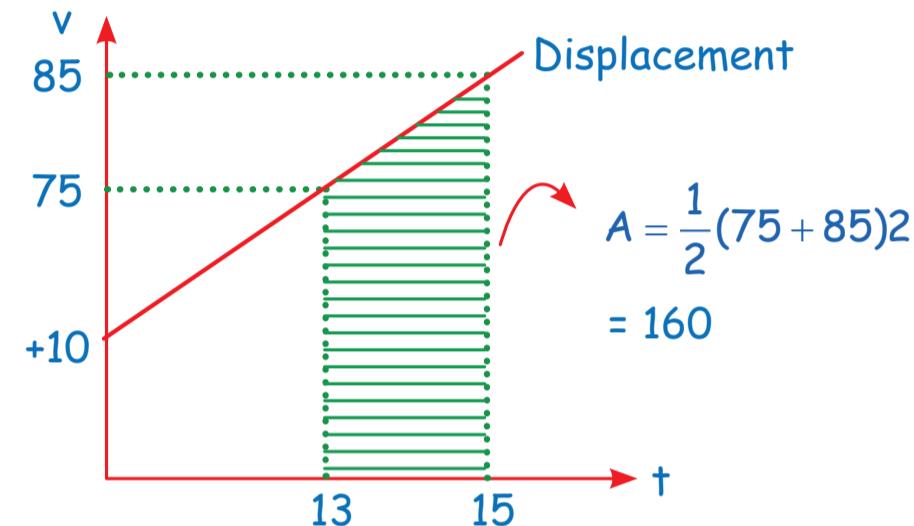

from (i) & (ii)

$$V_C^2 = 3600 - 1000 = 2600$$

$$V_C = 10\sqrt{26}$$

- Q.** A particle having initial velocity 10 m/s move with a constant acceleration 5 ms^{-2} , for a time 15 second along a straight line, what is the displacement of the particle in last 2 second?

Sol.

- Q.** A bullet is moving with a velocity of 200 cm/s. penetrates a wooden block & comes to rest after travelling 4cm insides it. What velocity is needed for travelling distance of 9cm in same block?

$$0^2 = 2^2 + 2a \times \frac{4}{100}$$

$$-4 = \frac{8}{100} a \Rightarrow a = -50$$

$$0^2 = u^2 + 2as$$

$$0 = u^2 + 2 \times (-50) \frac{9}{100}$$

$$u^2 = 9$$

$$u = 3 \text{ m/s}$$

- Q.** A bullet going with speed 350 m/s enters a concrete wall and penetrates a distance of 5.0 cm before coming to rest. Find the deacceleration

Sol. $U_f = 0, a = ?$

$$0^2 = (350)^2 + 2 \times a \times \frac{5}{100}$$

$$a = -(350)^2 \times 10$$

$$a = -1225000 \text{ m/s}^2$$

Q. A particle covered 100 m distance in first 10 s of its journey and in next 10 s it travel 200 m. Find distance travelled in next 10s? (acc is const)

$$\text{Sol. } t = 0 \rightarrow t = 10 \quad 100 = u \times 10 + \frac{1}{2} a \times 10^2 \quad \dots(i)$$

$$t = 0 \rightarrow t = 20 \quad 300 = u \times 20 + \frac{1}{2} a (20)^2 \quad \dots(ii)$$

Sol. From (i) and (ii) and get $a = 1, u = 5$

Let it travel x_3 in last 10s so in 30s it travel $300 + x_3$

$$300 + x_3 = 5 \times 30 + \frac{1}{2} \times 1 \times (30)^2$$

Sol. From (i) and (ii) and get $x_3 = 300$

Q. A particle moving with initial velocity of 10 m/s towards East has an acceleration of 5 m/s² towards west. Find the displacement and distance travelled by the particle in first 4 seconds?

$$\begin{array}{l} u = 10 \text{ m/s} \\ a = -5 \text{ m/s}^2 \\ t = 2 \end{array}$$

$$v = u + at \Rightarrow 0 = 10 - 5t \Rightarrow t = 2 \text{ s}$$

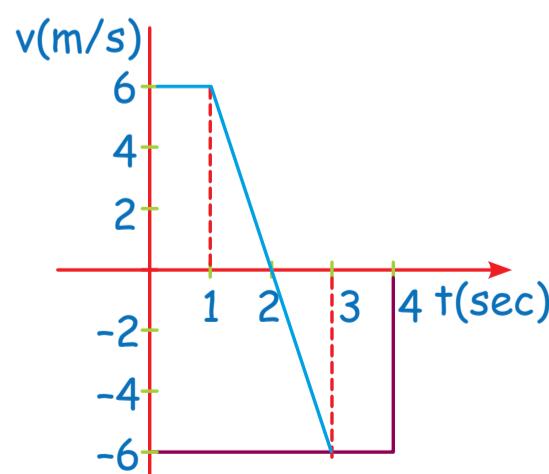

The direction of velocity changes after two seconds.

$$S = 10 \times 2 + \frac{1}{2} (-5) \times 2^2 = 0 = \text{displacement}$$

Distance travelled is not equal to displacement because during course of journey, velocity changes direction.

$$\begin{aligned} D &= S(\text{at } 2 \text{ s}) + |S(\text{at } 4 \text{ s}) - S(\text{at } 2 \text{ s})| \\ &= \left(10 \times 2 - \frac{1}{2} \times 5 \times 2^2 \right) + \left| 0 - (10 \times 2) - \frac{1}{2} \times 5 \times 2^2 \right| \\ &= 10 + 10 = 20 \text{ m} \end{aligned}$$

Q. A particle moves along a straight line along x-axis. At time $t = 0$, its position is at $x = 0$. The velocity v m/s of the object changes as a function of time t seconds as shown in the figure.

- (i) What is x at $t = 1$ sec?
- (ii) What is the acceleration at $t = 2$ sec?
- (iii) What is x at $t = 4$ sec?
- (iv) What is the average speed between $t = 0$ and $t = 3$ sec?

Sol. (i) x is displacement at $t = 1$ sec.

Area under the $v-t$ curve gives displacement
From $t = 0$ to $t = 1$ sec.

$$x = 6 \times 1 = 6 \text{ m}$$

(ii) Slope of the $v-t$ curve gives acceleration from the given $v-t$ curve

Slope at $t = 2$ sec. gives acceleration at $t = 2$ sec.

$$\tan \theta = a = -\frac{6}{1} = -6 \text{ m/s}^2$$

(iii) x (at $t = 4$ sec):

Area under the curve from $t = 0$ to $t = 4$ sec

$$= 6 \times 1 + \frac{1}{2} \times 6 \times 1 - \frac{1}{2} \times 6 \times 1 - 6 \times 1 = 0$$

$$\Rightarrow x(t = 4) = 0 \text{ m}$$

(iv) Average speed from $t = 0$ to $t = 3$ sec.

Displacement from $t = 0$ to $t = 2$ sec. = Area under the curve = $6 + \frac{1}{2} \times 6 \times 1 = 9 \text{ m}$

Displacement from $t = 2$ to $t = 3$ sec.

$$= -\frac{1}{2} \times 6 \times 1 = -3 \text{ m}$$

Distance from $t = 0$ to $t = 3$ sec = $|9| + |-3| = 12 \text{ m}$

$$\text{Average speed} = \frac{\text{Distance}}{\text{Time}} = \frac{12}{3} = 4 \text{ m/s}$$

Question Practice on Variable Acceleration and Uptang Integration

Q. The acceleration a of a particle moving in one dimension is given by $a = 6 - 2t$. If the particle is initially at $x = 0$ and its velocity is 2 m/s, find its position and velocity at time t .

$$\text{Sol. } \frac{dv}{dt} = 6 - 2t$$

$$\int_2^v dv = \int_0^t (6 - 2t) dt$$

$$\Rightarrow v - 2 = (6t - t^2)|_0^t = 6t - t^2 \Rightarrow v(t) = 2 + 6t - t^2$$

To find position, we integrate velocity.

$$v = \frac{dx}{dt} = 2 + 6t - t^2 \Rightarrow dx = (2 + 6t - t^2) dt$$

$$\int_0^x dx = \int_0^t (2 + 6t - t^2) dt = 2t + 3t^2 - \frac{t^3}{3}$$

$$\text{or } x(t) = 2t + 3t^2 - \frac{t^3}{3}$$

- Q.** The retardation of a car when its engine is shut off depends on its velocity as $a = -\alpha v$ where α is positive constant. Find the total distance travelled by the car if its initial velocity is 20 m/s and $\alpha = 0.5/\text{s}$.

$$\text{Sol. } \frac{dv}{dt} = -\alpha v$$

$$\frac{dv}{dx} \left(\frac{dx}{dt} \right) = -\alpha v \Rightarrow \frac{vdv}{dx} = -\alpha v$$

$$\text{or } dv = -\alpha dx$$

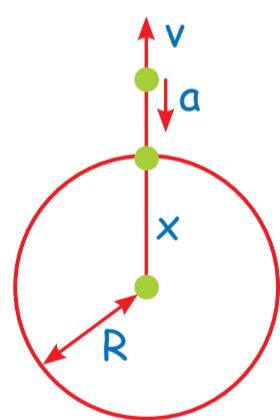

$$\int_{20}^0 dv = -\alpha \int_0^d dx \Rightarrow v|_{20}^0 = -\alpha x|_0^d$$

$$-20 = -\alpha d$$

$$d = \frac{20}{\alpha} = \frac{20}{0.5} = 40 \text{ m}$$

- Q.** With what velocity in vertical upward direction should a body be projected from the surface of earth so that it reaches a height equal to radius of earth? The acceleration of body is given by $a = -\frac{GM}{x^2}$ where x is the distance from centre of earth and M is the mass of earth.

- Sol.** Note that acceleration due to gravity is nearly constant near the surface of earth. But if the height become too large its dependence on distance can not be ignored.

$$a = \frac{dv}{dt} = -\frac{GM}{x^2}$$

$$\text{or } \frac{dv}{dx} \cdot \frac{dx}{dt} = -\frac{GM}{x^2} \Rightarrow vdv = -\frac{GM}{x^2} dx$$

At the highest point, velocity is zero. Also note $x_i = R$ and $x_f = 2R$.

$$\int_u^0 vdv = -GM \int_R^{2R} \frac{dx}{x^2}$$

$$\frac{v^2}{2} \Big|_u^0 = -GM \int_R^{2R} x^{-2} dx = \frac{GM}{x} \Big|_R^{2R}$$

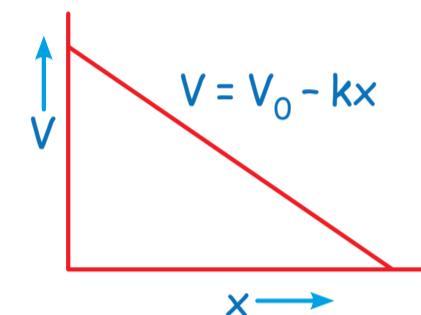

$$\Rightarrow -\frac{u^2}{2} = GM \left[\frac{1}{2R} - \frac{1}{R} \right]$$

$$\Rightarrow u^2 = \frac{GM}{R} \Rightarrow u = \sqrt{\frac{GM}{R}} = \sqrt{\frac{GM}{R^2}} R$$

$$\therefore g = \left(\frac{GM}{R^2} \right)$$

$$\therefore u = \sqrt{gR} = 8 \text{ km/s} [\because R = 6400 \text{ km}, g = 10 \text{ m/s}^2]$$

- Q.** A particle is moving along x -axis with velocity V which varies according to the law $V = V_0 - Kx$ here V_0 and K are constants. Choose the correct acceleration vs time plot for the time interval when particle moves from $x = 0$ to $x = \frac{V_0}{K}$.

$$\text{Sol. } V = V_0 - Kx$$

$$\frac{dx}{dt} = (V_0 - Kx) \Rightarrow \int_0^x \frac{dx}{(V_0 - Kx)} = \int_0^t dt$$

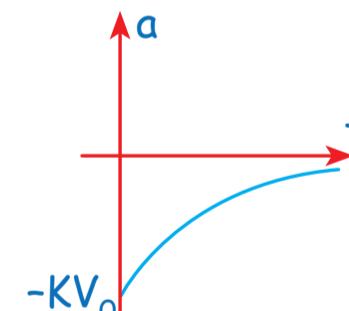

$$x = \frac{V_0}{K} (1 - e^{-Kt})$$

$$\therefore \frac{dx}{dt} = +V_0 e^{-Kt} \Rightarrow a = \frac{d^2x}{dt^2} = -KV_0 e^{-Kt}$$

$$\text{At } t = 0, a = -KV_0$$

$$\text{At } t = \infty, a = 0$$

Therefore, graph is as shown

- Q.** A block of mass m is fired horizontally along a level surface that is lubricated with oil. The oil provides a viscous resistance that varies as the $3/2$ power of the speed. If the initial speed of the block is v_0 at $x = 0$, find the maximum distance reached by the block. Assume no resistance to motion other than that provided by the oil.

$$\text{Sol. } F = -v^{3/2}$$

$$a = -\frac{1}{m} v^{3/2}$$

$$v \frac{dv}{dx} = -\frac{1}{m} v^{3/2}$$

$$[\because F = ma]$$

$$\int_{v_0}^0 v^{-\frac{1}{2}} dv = -\frac{1}{m} \int_0^d dx$$

$$2mv_0^{1/2} = d$$

Q. Acceleration of particle moving rectilinearly is $a = 4 - 2x$ (where x is position in metre and a in m/s^2). It is at rest at $x = 0$. At what position x (in metre) will the particle again come to instantaneous rest?

$$\text{Sol. } \frac{vdv}{dx} = 4 - 2x$$

$$\int_v^0 v dv = \int_0^x (4 - 2x) dx \Rightarrow \frac{v^2}{2} = 4x - x^2$$

$$\text{when } v = 0, 4x - x^2 = 0$$

$$x = 0, 4$$

\therefore At $x = 4$ m, the particle will again come to rest.

Question for Practice

Q. A particle starts motion at $t = 0$ from $x = +10$, such that its 'v' vs t relation is given as $v = 4t^3 + 3t^2 + 2t$. Find location of particle at $t = 1$ sec.

$$\text{Sol. } x = \int v dt$$

$$x = t^4 + t^3 + t^2 + c$$

$$t = 0, x = 10 \quad (\text{put } t = 0, x = 10)$$

$$10 = 0 + 0 + 0 + c$$

$$c = 10$$

$$x = t^4 + t^3 + t^2 + 10$$

$$t = 1, x = 13$$

Q. A particle starts motion from $x = 5$, at $t = 0$ such that $v = t^2 + t$. Find location of particle at $t = 6$ sec.

$$\text{Sol. } dx = v dt$$

$$\int_{x=5}^{x_f} dx = \int_{t=0}^{t=6} (t^2 + t) dt$$

$$x_f |_{x=5}^{x_f} = (t^3 / 3 + t^2 / 2) \Big|_0^6$$

$$x_f - 5 = \left(\frac{6^3}{3} + \frac{6^2}{2} \right) - \left(\frac{0^3}{3} + \frac{0^2}{2} \right)$$

$$x_f - 5 = 72 + 18 - 0$$

$$x_f = 90 + 5$$

$$x_f = 95 \text{ Ans}$$

Q. A particle starts motion from rest from origin at $t = 0$ such that $a = 6t$ find v , x (location) at, $t = 2$ sec

$$\text{Sol. } a = 6t$$

$$v = \int a dt = \int 6t dt$$

$$v = 6t^2 / 2 + c$$

$$v = 3t^2 + c$$

$$t = 0, v = 0$$

$$0 = 0 + c$$

$$c = 0$$

$$v = 3t^2$$

$$t = 2, v = 12$$

$$x = \int 3t^2 dt = 3t^3 / 3 + c'$$

$$x = t^3 + c'$$

$$t = 0, x = 0, 0 = 0 + c \rightarrow c' = 0$$

$$x = t^3$$

$$t = 2, x = 8, v = 12$$

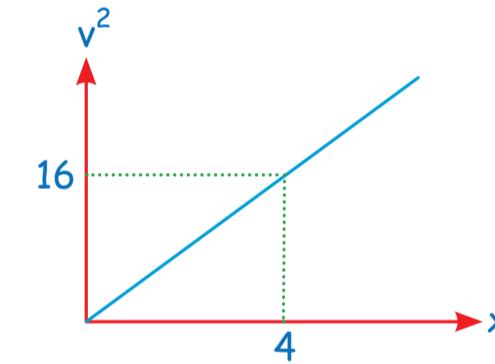

Q. If $v = x^2 + 3x$ Find acc at $x = 2$

$$\text{Sol. } a = v \frac{dv}{dx} \quad \frac{dv}{dx} = 2x + 3$$

$$a = (x^2 + 3x)(2x + 3)$$

$$\text{put } x = 2, a = 70$$

Q. Find acc at $x = 4$

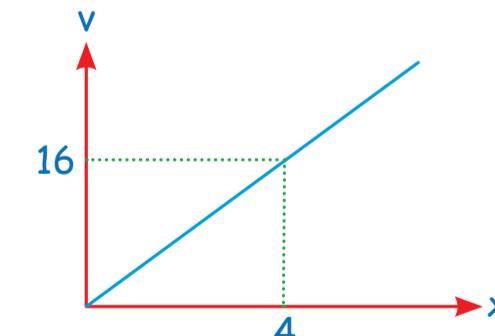

$$\text{Sol. slope} = \frac{dy}{dx} = \frac{d(v^2)}{dx}$$

$$16 / 4 = 2v \frac{dv}{dx}$$

$$4 = 2a \rightarrow a = 2$$

Q. Find acc at $x = 4$

$$\text{Sol. slope} = \frac{dy}{dx} = \frac{dv}{dx} = 16 / 4$$

$$a = v \frac{dv}{dx}$$

$$a = 16 \times \frac{16}{4} = \boxed{64}$$

Q. $x = \sqrt{v+1}$ find acc at $x = 5$

Sol. $x^2 = v + 1$

$$v = x^2 - 1$$

$$a = v \frac{dv}{dx} = (x^2 - 1)(2x)$$

$$x = 5 \Rightarrow a = 240$$

Q. Acceleration of a particle moving on x -axis having initial speed v_0 with distance from origin is given by $a = \sqrt{x}$. Distance covered by particle where its speed become thrice that of initial speed.

Sol. $a = \sqrt{x}$

$$a > 0, \text{ speed } 1, v > 0$$

$$v \frac{dv}{dx} = \sqrt{x}$$

$$\int v dv = \sqrt{x}$$

$$\int_{V_0}^{3V_0} v dv = \int_0^{x_f} x^{1/2} dx$$

$$\frac{v^2}{2} \Big|_{V_0}^{3V_0} = \frac{x^{1/2+1}}{1/2+1} \Big|_0^{x_f}$$

$$\frac{9V_0^2}{2} - \frac{V_0^2}{2} = \frac{2}{3} x^{3/2} \Big|_0^{x_f}$$

$$\frac{8V_0^2}{2} = 2/3 x_f^{3/2}$$

Q. $x = a \sin \omega t$

$$y = a(1 - \cos \omega t) = a - a \cos \omega t$$

Find \vec{v} , speed of particle

Sol. $v_x = a\omega \cos \omega t$

$$v_y = 0 - a\omega [-\sin \omega t]$$

$$v_y = a\omega \sin \omega t$$

$$\vec{v} = (a\omega \cos \omega t) \hat{i} + (a\omega \sin \omega t) \hat{j}$$

speed = ? magnitude

$$|\vec{v}| = \sqrt{(a\omega \cos \omega t)^2 + (a\omega \sin \omega t)^2}$$

$$= a\omega \sqrt{\cos^2 \omega t + \sin^2 \omega t}$$

$$\text{speed} = a\omega$$

MOTION UNDER GRAVITY

It's very important article जिसमें हम particle का motion under the effect of gravity पढ़ेंगे.....

Assumption

1. Air resistance force is neglected until mention.
2. Variation of gravity g is neglected until mention.

भृत्या kinematics के ques में समझ नहीं आता कैसे करना है sign convention में भी दिक्कत होती है sol. तो समझ आ जाते हैं पर सवाल खुद से नहीं बनते इसका कोई इलाज.....

हाँ भाई सबसे पहले तो जोर से घुटना लगाओ..... फिर जो given है वो लिख लो जो पूछा है वो भी लिखलो और देखो कौन-सी eqn of motion connect हो रही है।
+/- जहाँ मन करे ऊपर या नीचे मान सकते हो ans. same आएगा बस इस बात का ध्यान रखना u, s, a को with sign लिखना है।

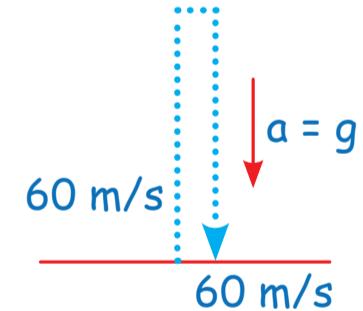

Q. A particle is projected from ground vertically upward with velocity 60 m/s. (1) Find velocity and location of particle at $t = 10$ (2). When will particle come to rest (3). Find h_{\max} , time of flight.

Sol. Sign convention

Let upward direction (+ve)

$$u = 60 \text{ upar} = +60$$

$$a = 10 \text{ neeche} = -10$$

★ $t = 10, v = u + at = 60 + (-10)(10)$

$$v = \textcircled{-} 40 \quad \text{नीचे}$$

★ location $= y = 60 \times 10 + 1/2 (-10)(10)^2 = \textcircled{+} 100$ ऊपर

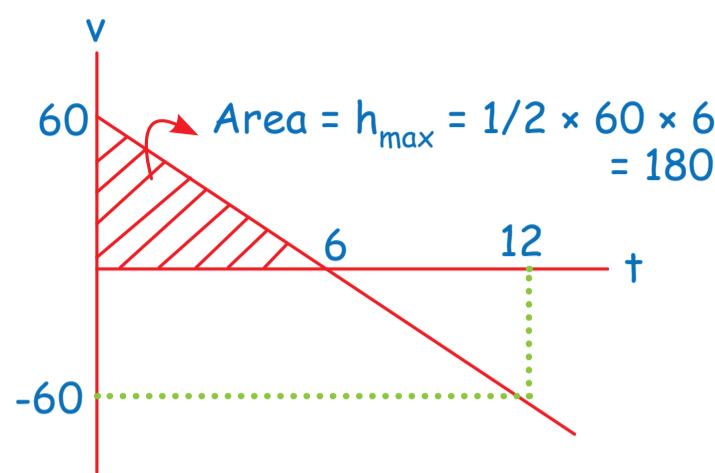

★ When particle will come to rest

$$v = u + at \Rightarrow 0 = 60 - 10t \Rightarrow t = 6$$

★ $0^2 = 60^2 + 2 \times (-10) h_{\max}$

$$h_{\max} = 180$$

* Time of flight = $6 + 6 = 12 \text{ sec}$

भईया जब particle ऊपर जाता है तब उसका acceleration नीचे होता है और जब नीचे आता है तब भी उसका acceleration नीचे होता है।

हाँ भाई अभी के लिए बस तु ये याद रख अगर particle हवा में है तो उसका acceleration g होगा चाहे ऊपर जाए या नीचे..... particle उधर जाता है जिस तरफ उसकी velocity होती है और उसका acceleration उधर होता है जिस तरफ उस पर net force होता है।

Q. A particle is thrown vertically downward with velocity 60 m/s from top of a tower of height 320 m . Find when particle will hit the ground & with what velocity & $V_f = ?$

Sol. Let (Downward +ve)

$$u = +60 \quad a = +10$$

* displacement $s = ut + \frac{1}{2}at^2$

$$+320 = 60t + \frac{1}{2} \times 10 \times t^2$$

$$t^2 + 12t - 64 = 0$$

$$(t + 16)(t - 4) = 0 \Rightarrow t = 4 \text{ s}$$

* $V_f = ?$

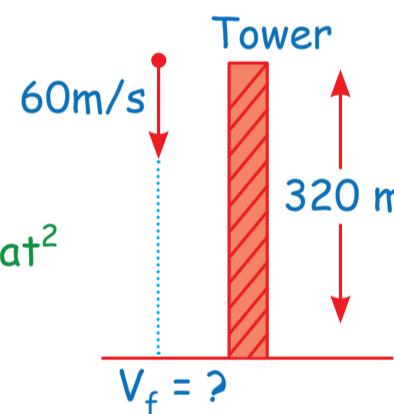

$$V^2 = u^2 + 2as$$

$$V^2 = 60^2 + 2 \times 10 \times 320$$

$$V^2 = 3600 + 6400$$

$$V^2 = 10000$$

$$V_f = \text{velocity } V = 100 \text{ (नीचे)}$$

Q. A particle is thrown vertically upward with velocity 40 m/s from top of a tower of height 240 m . Find when particle will hit the ground & with what velocity & $V_f = ?$

Sol. (1) let (up = +ve)

$$u = +40, a = -10, s = -240$$

$$s = ut + \frac{1}{2}at^2$$

$$-240 = 40t + 1/2 (-10)t^2$$

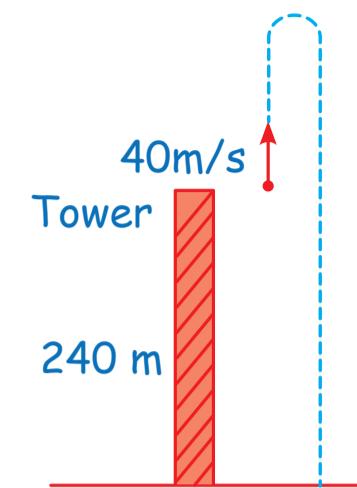

$$5t^2 - 40t - 240 = 0$$

$$(t - 12)(t + 4) = 0$$

$$t = 12$$

$$(2) V^2 = u^2 + 2as = (40)^2 + 2 \times (-10) (-240)$$

$$V = 80$$

Q. A balloon is rising upward with constant velocity 40 m/s . When it reaches at a height of 240 m from ground a particle is drop from it. Find when will particle hit the ground with what velocity?

Ans. $t = 12, v = 80 \text{ m/s}$

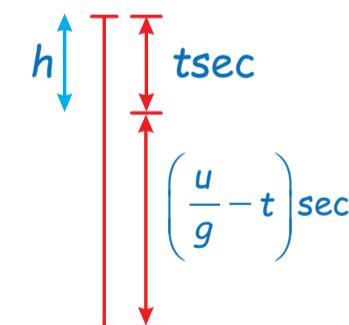

SKC

अगर हम किसी चलती हुई गाड़ी लिफ्ट और उड़ते हुए गुब्बारे से किसी particle को drop करे तो drop के just बाद particle की velocity वही होती जो उस गाड़ी, लिफ्ट और गुब्बारे की हो। So, अब ये सवाल तो वही टावर वाला सवाल है।

Q. If a ball is thrown vertically upwards with speed u , the distance covered during the last t seconds of its ascent is

Sol. If ball is thrown with velocity u , then time of ascent $= \frac{u}{g}$

$$\text{Velocity after } \left(\frac{u}{g} - t\right) \text{ sec}, \quad v = u - g \left(\frac{u}{g} - t\right) = gt.$$

$$\text{So, distance in last 't' sec, } 0^2 = (gt)^2 - 2(g)h.$$

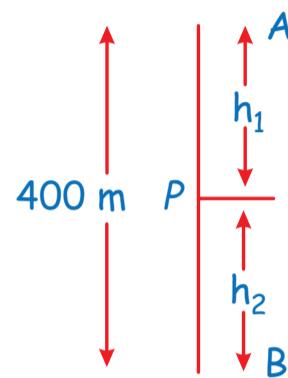

$$h = \frac{1}{2}gt^2.$$

Q. A man drops a ball downside from the roof of a tower of height 400 m. At the same time another ball is thrown upside with a velocity 50 m/s from the foot of tower. What is the height from the foot of the tower where the two balls would meet?

Sol. Let both balls meet at point P after time t.

The distance travelled by ball A

$$h_1 = \frac{1}{2}gt^2$$

The distance travelled by ball B

$$h_2 = ut - \frac{1}{2}gt^2$$

$$\text{By adding (i) and (ii)} h_1 + h_2 = ut = 400$$

$$(\text{Given } h = h_1 + h_2 = 400)$$

$$\therefore t = 400/50 = 8 \text{ s and } h_1 = 320 \text{ m, } h_2 = 80 \text{ m}$$

Q. Water drops fall at regular intervals from a tap which is 5 m above the ground. The third drop is leaving the tap at the instant the first drop touches the ground. How far above the ground is the second drop at that instant?

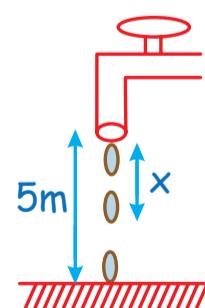

Sol. Let the interval between each drop be t then from question

$$\text{For first drop } \frac{1}{2}g(2t)^2 = 5 \quad \dots(i)$$

$$\text{For second drop } x = \frac{1}{2}gt^2 \quad \dots(ii)$$

$$\text{By solving (i) and (ii)} x = \frac{5}{4} \text{ and}$$

$$\text{Hence required height } h = 5 - \frac{5}{4} = 3.75 \text{ m.}$$

Q. A balloon is at a height of 81 m and is ascending vertically upward with a velocity of 12 m/sec. A body of 2 kg weight is dropped from it. If $g = 10 \text{ m/s}^2$ the body will reach the surface of the earth in

Sol. As the balloon is going up so initial velocity of balloon

$$= + 12 \text{ m/s,}$$

$$\Delta y = - 81 \text{ m; } a = - g = - 10 \text{ m/s}^2$$

$$\text{By applying } h = ut + \frac{1}{2}gt^2; - 81 = 12t - \frac{1}{2}(10)t^2$$

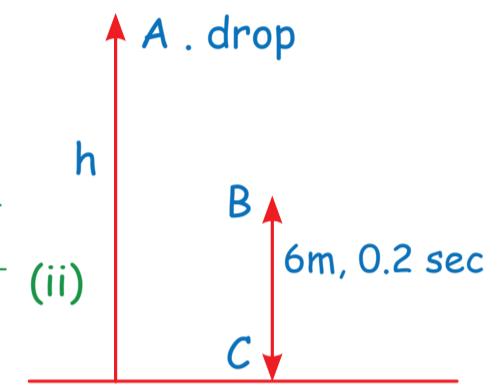

$$\Rightarrow 5t^2 - 12t - 81 = 0$$

$$\Rightarrow t = \frac{12 \pm \sqrt{144 + 1620}}{10} = \frac{12 \pm \sqrt{1764}}{10} = 5.4 \text{ s}$$

Q. A ball dropped from a height h from ground, if it take 0.2 sec to cross the last 6m before hitting the ground. Find height from which it was dropped.

$$\text{Sol. } t_{A \rightarrow C} = t = \sqrt{\frac{2h}{g}} \quad \dots(i)$$

$$t_{A \rightarrow B} = t - 0.2 = \frac{\sqrt{2(h-6)}}{g} \quad (ii)$$

PROJECTILE MOTION

भाई ये बहुत मजेदार chapter है बस यहाँ x और y दोनों में motion हो रहा है, बस ये याद रखना x और y दो independent axis है तो दोनों के साथ independently खेलना है जब x के साथ हो तो y को भूल जाओ और जब y के साथ हो तो x को भूल जाओ it's like your gf... अब समझ गया ना।

In this chapter

★ Air Resistance neglected until mention

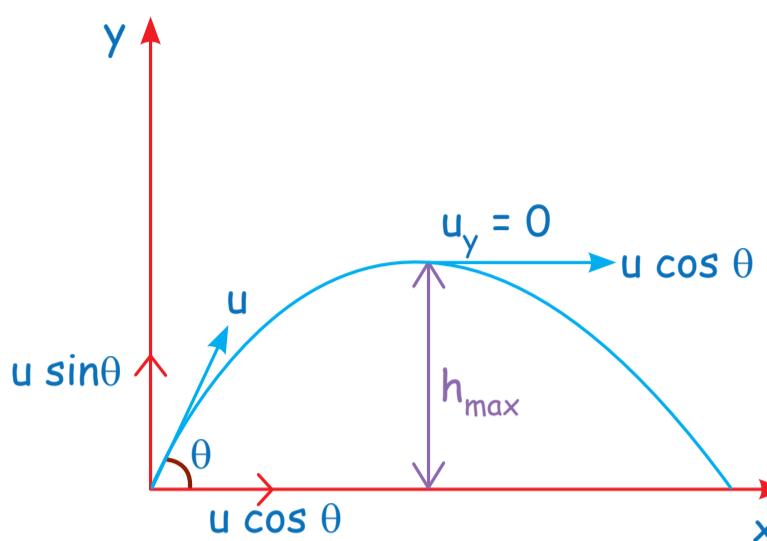

★ variation of g neglected $g = 10 \text{ m/s}^2$ (downward)

$$g = 9.8 \text{ m/s}^2$$

★ Since, $a_x = 0 \Rightarrow v_x = \text{const} = u \cos \theta$

★ Particle चाहे ऊपर जा रहा हो या नीचे आ रहा हो उसका acc नीचे की तरफ g होगा

A particle is projected with speed u at angle θ with the horizontal as shown in fig.

1. Time of flight (T)

$$u_y = u \sin \theta,$$

$$a_y = -g$$

$$v = u + at$$

$$0 = u \sin \theta - gt$$

$$t = u \sin \theta / g \text{ (time to reach highest point)}$$

$$T = 2t = \frac{2u \sin \theta}{g}$$

2. Maximum height (h_{\max})

$$v^2 = u^2 + 2as \quad (y)$$

$$0 = (u \sin \theta)^2 - 2g h_{\max}$$

$$h_{\max} = \frac{u^2 \sin^2 \theta}{2g}$$

Here,
Kinematics का
सबसे बड़ा हथियार
 $a_x = 0$ means
horizontal
में velocity
constant रहेगी।

3. Range = $u \cos \theta \times T$

$$R = u \cos \theta \times \frac{2u \sin \theta}{g} = \frac{u^2 2 \sin \theta \cos \theta}{g}$$

$$R = \frac{u^2 \sin 2\theta}{g}$$

For R to be maximum by keeping u fix $\sin 2\theta$ should be maximum $\Rightarrow 2\theta = 90^\circ \Rightarrow \theta = 45^\circ$

If u is fixed then from ground to ground projectile range will be maximum at $\theta = 45^\circ$

काम का डब्बा ($a_x = 0$, ground to ground)

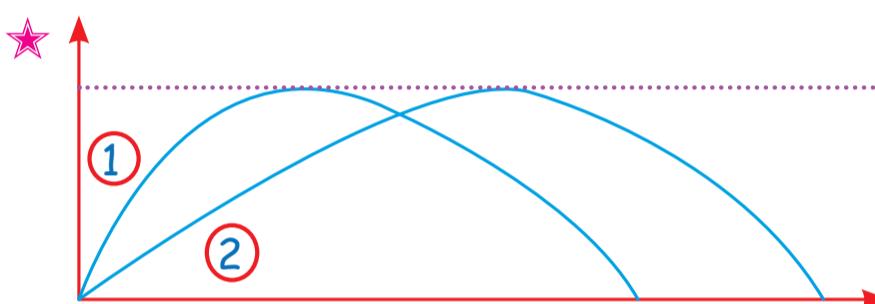

$$T = \frac{2u \sin \theta}{g} = \frac{2U_y}{a_y}$$

$$H_{\max} = \frac{(u \sin \theta)^2}{2g} = \frac{U_y^2}{2a_y}$$

$$R = \frac{u^2 \sin 2\theta}{g} = U_x T = \frac{2U_x U_y}{a_y}$$

★ If vertical velocity same $\Rightarrow T, h_{\max}$, same.

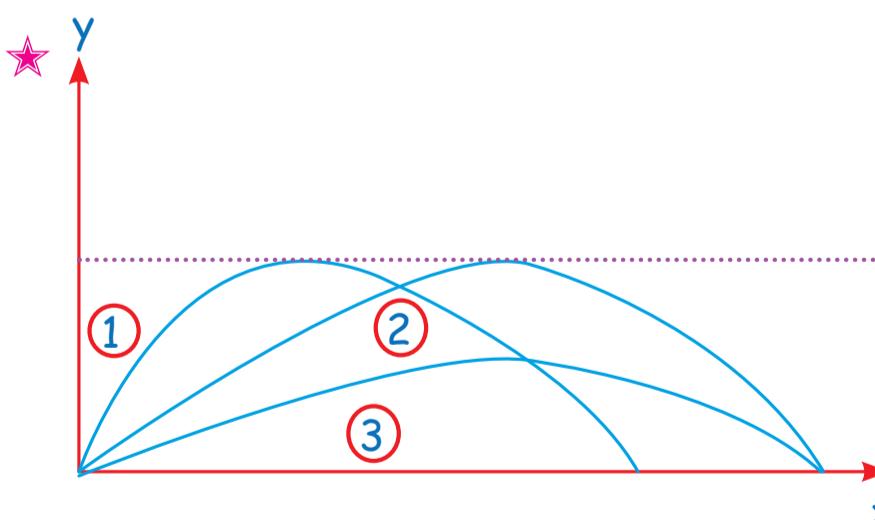

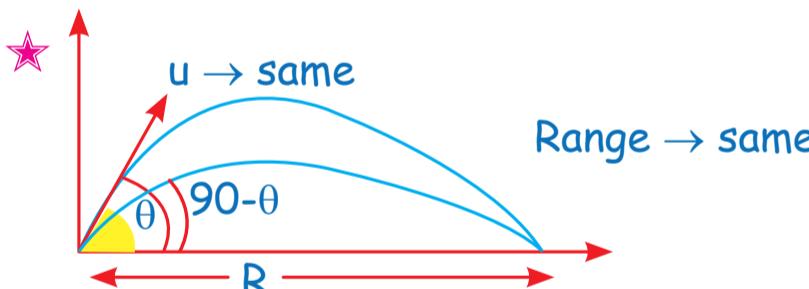

★ If $U \rightarrow$ fix, at θ and $90^\circ - \theta \Rightarrow$ Range Same

$H_{\max} \rightarrow$ same

$U_y \rightarrow$ same

$$u_1 \sin \theta = u_2 \sin \theta_2$$

★ $(H_{\max})_1 = (H_{\max})_2 > (H_{\max})_3$

★ $T_1 = T_2 > T_3$

$$(U_y)_1 = (U_y)_2 > (U_y)_3$$

$$R_1 < R_2 = R_3$$

Q. A particle is projected from ground with speed at an angle θ with horizontal such that its maximum height is half of range. Find θ

Sol. $h_{\max} = \frac{1}{2} R$

$$\frac{u^2 \sin^2 \theta}{2g} = \frac{1}{2} \frac{u^2 \sin 2\theta}{g}$$

$$\sin^2 \theta = \sin 2\theta$$

$$\sin^2 \theta = 2 \sin \theta \cos \theta$$

$$\tan \theta = 2$$

$$\theta = \tan^{-1}(2)$$

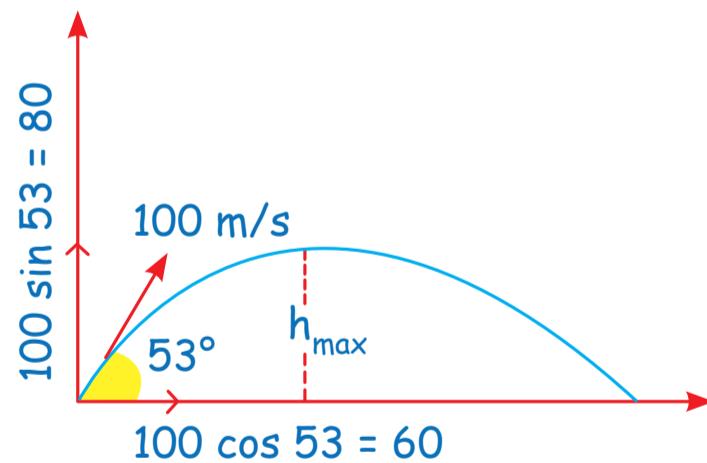

Q. Two particles are projected with same speed at angles 30° & 60° . Find Ratio of their max height, range and time of flight respectively.

$$\text{Sol. (1)} \frac{(h_{\max})_1}{(h_{\max})_2} = \frac{\left(\frac{u^2 \sin^2 30}{2g}\right)}{\left(\frac{u^2 \sin^2 60}{2g}\right)} = \frac{(1/2)^2}{(\sqrt{3}/2)^2} = \frac{1}{3}$$

$$\text{Sol. (2)} \frac{R_1}{R_2} = \frac{\left(\frac{u^2 \sin(2 \times 30)}{g}\right)}{\left(\frac{u^2 \sin(2 \times 60)}{g}\right)} = \frac{\sin 60}{\sin 120} = \frac{\sqrt{3}/2}{\sqrt{3}/2} = 1$$

$$\text{Sol. (3)} T = \frac{2u \sin \theta}{g} \therefore \frac{T_1}{T_2} = \frac{\sin 30}{\sin 60} = \frac{1/2}{\sqrt{3}/2} = \frac{1}{\sqrt{3}}$$

Q. A particle is projected with velocity 100 m/s at angle of 53° with the horizontal, answer following parts.

1. Find initial velocity, acc

Sol. $\vec{u} = 60\hat{i} + 80\hat{j}$

2. Acceleration.

$$\vec{a} = g \text{ नीचे}$$

$$\vec{a} = 0\hat{i} - 10\hat{j}$$

3. Find time of flight

Sol. $T = 8 + 8 = 16 \text{ sec.}$

4. Range = ?

Sol. $60 \times 16 = 960$

5. Find velocity at

Sol.

$$t = 2 \quad v_y = 60\hat{j}$$

$$t = 8 \quad v_y = 0\hat{j}$$

$$t = 10 \quad v_y = -20\hat{j}$$

$$t = 16 \quad v_y = -80\hat{j}$$

$$\vec{v} = 60\hat{i} + 60\hat{j}$$

$$\vec{v} = 60\hat{i} + 0\hat{j}$$

$$\vec{v} = 60\hat{i} - 20\hat{j}$$

$$\vec{v} = 60\hat{i} - 80\hat{j}$$

6. Find change in momentum for entire path ($m = 1 \text{ kg}$) (momentum = mass \times velocity)

Sol. $\Delta \vec{P} = \vec{P}_f - \vec{P}_i$

$$\vec{P}_i = m \vec{v}_i = 1(60\hat{i} + 80\hat{j}) \quad \vec{P}_f = 60\hat{i} - 80\hat{j}$$

$$\Delta \vec{P} = \vec{P}_f - \vec{P}_i = 0\hat{i} - 160\hat{j}$$

$$\Delta \vec{P} = -160\hat{j}$$

7. Find h_{\max}

Sol. $v^2 = u^2 + 2as$

$$0^2 = (80)^2 + 2(-10) h_{\max}$$

$$h_{\max} = 320$$

8. Find \vec{V} at any time

Sol. $V = u + at$

$$V_y = 80 - 10t$$

$$\vec{V} = 60\hat{i} + (80 - 10t)\hat{j}$$

9. Find time when \vec{v} become perpendicular to \vec{a}

Sol. $\vec{V}_i = 60\hat{i} + (80 - 10t)\hat{j}$

$$\vec{a} = -10\hat{j}$$

$$\vec{V}_i \cdot \vec{a} = -10(80 - 10t) = 0$$

$$t = 8$$

10. Find the time when velocity of particles become perpendicular to initial velocity.

Sol. $\vec{V} = 60\hat{i} + 80\hat{j}$

$$\vec{V}_f = 60\hat{i} + (80 - 10t)\hat{j}$$

$$\vec{V}_i \cdot \vec{V}_f = 0$$

$$60 \times 60 + 80(80 - 10t) = 0$$

$$3600 + 6400 - 800t = 0$$

$$t = \frac{10000}{800} = \frac{100}{8} = 12.5$$

11. Find location of particle at $t = 8$

Sol. $t = 8, x = 60 \times 8 = 480$

$$y = 80 \times 8 - \frac{1}{2} \times 10 \times 8^2$$

$$y = 640 - 320 = 320$$

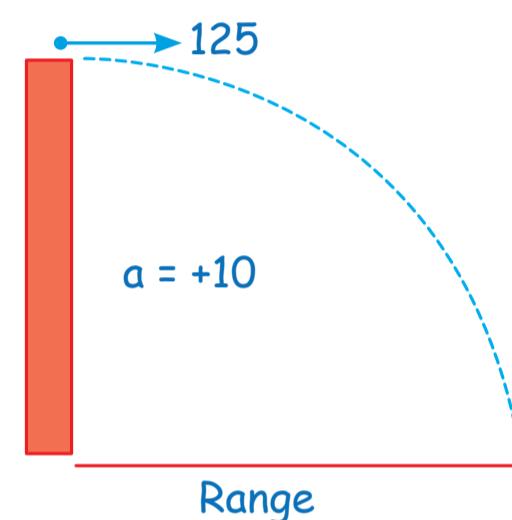

$$(x, y) = (480, 320)$$

Q. A particle is projected horizontally with velocity 40m/s from top of a tower of height 500 m above ground. Calculate range.

Sol. $u_y = 0, a_y = +10, s_y = +500$

$$s = ut + 1/2 at^2$$

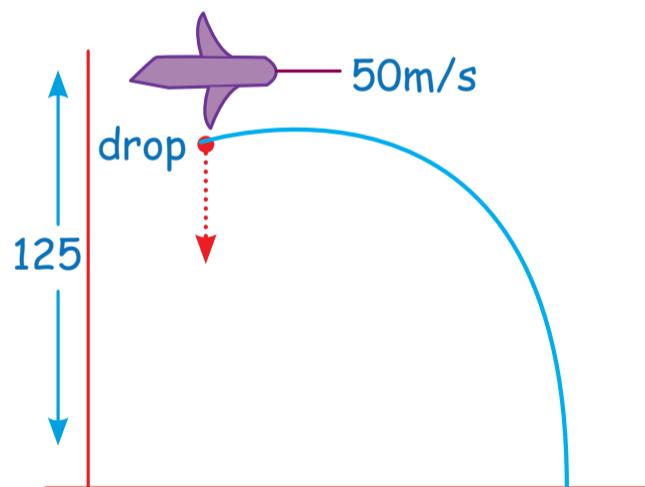

$$500 = 0 + 1/2 \times 10 \times t^2$$

$$t = 10 \text{ sec.}$$

$$\text{Range: } 40 \times 10 = 400 \text{ m}$$

Q. A body is dropped from plane. Calculate range.

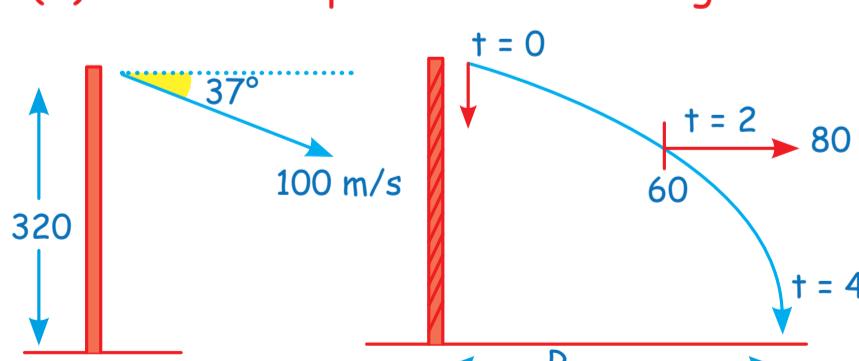

Sol. $t = \sqrt{\frac{2h}{a}} = \sqrt{2 \times 125 / 10} = 5$

$$R = 50 \times 5 = 250 \text{ m}$$

Q. (1) When will particle strike the ground?

(2) Where will particle strike the ground

Sol. (1) $y = \downarrow +\text{ve} \quad s = ut + 1/2 at^2$

$$320 = 60 t + (1/2)10at^2$$

$$5t^2 + 60t - 320 = 0$$

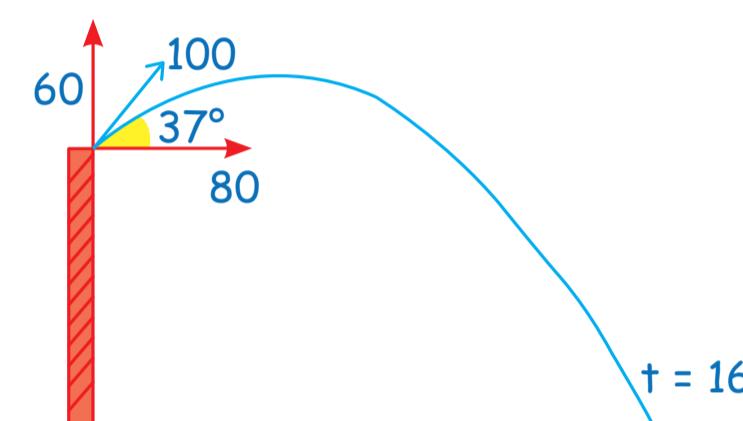

$$\Rightarrow t = 4 \text{ sec}$$

$$(2) \text{ Range: } \rightarrow 80 \times 4 = 320$$

Q. A particle is thrown with velocity 100 m/s at an angle of 37° with horizontal from a tower of height 320 m.

(A) Find when particle will hit the ground and where. (Take upward direction is positive)

Sol. (a) $u_y = +60, a_y = -10, s_y = -320$

$$-320 = 60t - 1/2 \times 10 \times t^2$$

$$t = 16 \text{ sec}$$

$$R = 80 \times 16$$

(B) Find speed of particle at $t = 16 \text{ sec}$

$$\vec{v} = 80\hat{i} - 100\hat{j}$$

$$|\vec{v}| = \sqrt{80^2 + 100^2}$$

(C) Find angle made by horizontal at $t = 16 \text{ sec}$

$$t = 16, v = 80\hat{i} - 100\hat{j}$$

$$\tan \alpha = 100/80$$

$$\alpha = \tan^{-1} 5/4$$

Equation of Trajectory

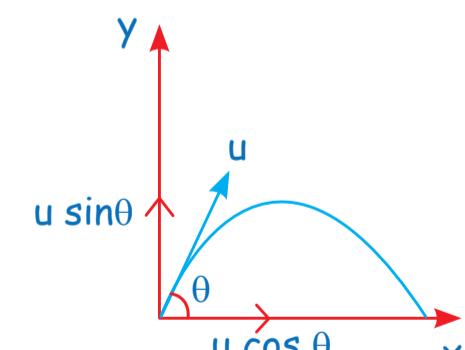

$$x = u \cos \theta \cdot t \Rightarrow t = \frac{x}{u \cos \theta}$$

$$y = u \sin \theta t - 1/2 gt^2$$

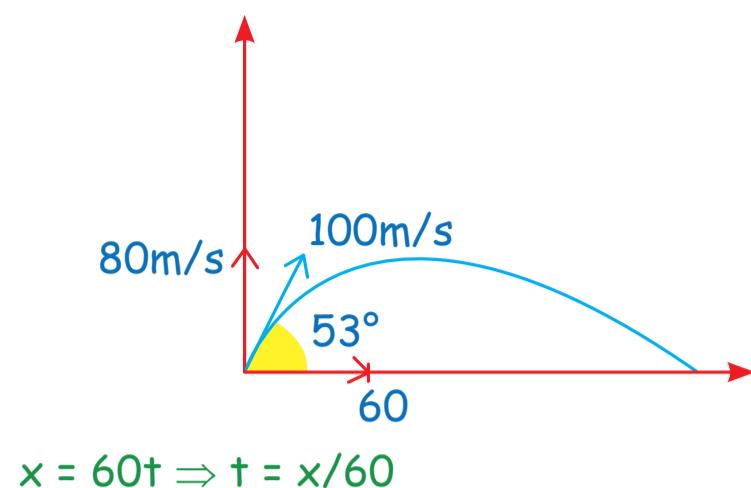

$$y = u \sin \theta \frac{x}{u \cos \theta} - \frac{1}{2} g \frac{x^2}{u^2 \cos^2 \theta}$$

$$y = x \tan \theta - \frac{1}{2} g \frac{x^2}{u^2 \cos^2 \theta}$$

$$y = x \tan \theta (1 - x/R)$$

Q. Find equation of trajectory.

$$x = 60t \Rightarrow t = x/60$$

$$y = 80t - 1/2 \times 10 \times t^2$$

$$y = 80 \frac{x}{60} - \frac{1}{2} \times 10 \times \left(\frac{x}{60}\right)^2$$

$$y = \frac{4x}{3} - \frac{x^2}{720}$$

Q. If equation of trajectory is given by

$$y = x\sqrt{3} - \frac{x^2}{20}. \text{ Find } u, \theta.$$

$$\text{Sol. } y = x\tan\theta - 1/2g \frac{x^2}{u^2\cos^2\theta} \text{ (Formula)}$$

$$\Rightarrow \sqrt{3} = \tan\theta$$

$$\theta = 60^\circ$$

$$\frac{1}{20} = \frac{g}{2u^2\cos^2\theta}$$

$$\frac{1}{20} = \frac{10}{2u^2\cos^2 60}$$

Solve and get $u = 20$

To find the range directly

$$y = x\sqrt{3} - \frac{x^2}{20} = x\sqrt{3} \left(1 - \frac{x}{20\sqrt{3}}\right)$$

Compare this with $y = x\tan\theta(1 - x/R)$

$$\tan\theta = \sqrt{3}, R = 20\sqrt{3}$$

or Put $y = 0$ and get $x = R$

Q. If eqn of trajectory of a projectile from ground to ground is given as $y = 4x - \frac{x^2}{4}$. Find Range = ?

$$\text{Sol. } y = 4x(1-x/16)$$

$$y = x \tan\theta (1-x/R)$$

$$R = 16$$

Q. $y = ax - bx^2$ find θ and Range

$$\text{Sol. } y = ax (1 - bx^2/ax)$$

$$R = a/b$$

$$y = ax (1 - bx/a)$$

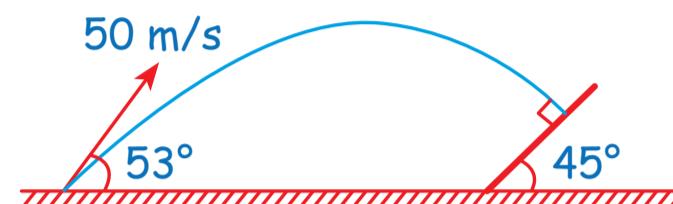

$$\tan\theta = a$$

$$y = 2 \tan\theta (1 - x/R)$$

$$\theta = \tan^{-1} a$$

Q. In following figure particle strike the inclined plane perpendicularly. Find

Time of collision and coordinate of point where particle collide if projection point is origin.

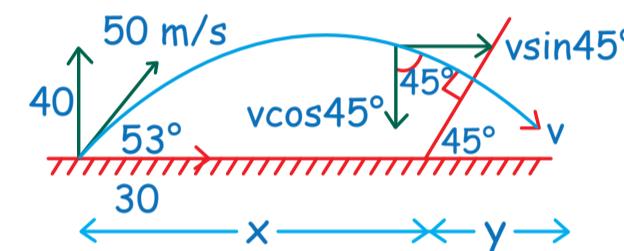

Sol. At the time of collision,

$$v\sin 45^\circ = 50\cos 53^\circ \Rightarrow v = 30\sqrt{2}$$

$$v_y = 50\sin 53^\circ - 10T \Rightarrow -30\sqrt{2} \cos 45^\circ = 40 - 10T$$

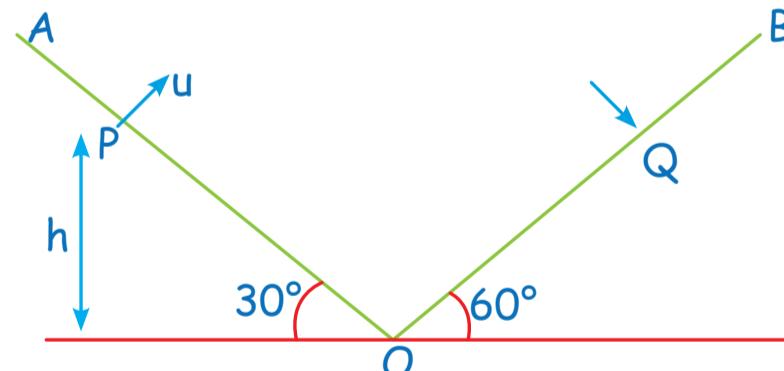

$$\Rightarrow T = 7 \text{ sec}$$

$$x = u \cos\theta \times T = 30 \times 7 = 210$$

$$y = 40 \times 7 - \frac{1}{2} \times 10 \times 7^2 = 35$$

Q. A particle thrown perpendicularly to an inclined plane and it's strike perpendicularly to another inclined plane with speed 100 m/s as shown in fig. Find with what velocity it will strike the inclined.

Sol. $u \cos 60^\circ = 100 \cos 30^\circ$ (By keeping horizontal velocity)

SKC

Projectile motion का सबसे बड़ा हथियार horizontal में velocity constant करना।

$$100 \times 1/2 = v \frac{\sqrt{3}}{2} \Rightarrow v = \frac{100}{\sqrt{3}}$$

Q. A particle is moving such that

$$x = 4t^2$$

$$y = 2t^3$$

$$z = 4t^4$$

Find velocity at $t = 2$ sec \rightarrow

$$\text{Sol. } u_x = \frac{dx}{dt} = 8t$$

$$\text{Velocity} = 8\hat{i} + 6t^2\hat{j} + 16t^3\hat{k}$$

$$u_y = \frac{dy}{dt} = 6t^2$$

$$\text{acc} = 8\hat{i} + 12t\hat{j} + 48t^2\hat{k}$$

$$u_z = \frac{dz}{dt} = 16t^3$$

$$\vec{v} = 8\hat{i} + 6t^2\hat{j} + 16t^3\hat{k}$$

Q. A particle is moving such that $\vec{r} = 3t^2 + 2t^3\hat{j} + 10t\hat{k}$

Find angle between \vec{v} & \vec{a} at $t = 1$ sec.

$$\text{Sol. } \vec{v} = 6t\hat{i} + 6t^2\hat{j} + 10\hat{k}$$

$$\vec{a} = 6\hat{i} + 12t\hat{j} + 0\hat{k}$$

$$\text{At } t = 1, \quad \vec{v} = 6\hat{i} + 6\hat{j} + 10\hat{k}$$

$$\vec{a} = 6\hat{i} + 12\hat{j}$$

$$\vec{a} \cdot \vec{v} = av \cos \theta$$

$$\cos \theta = \frac{\vec{a} \cdot \vec{v}}{av} = \frac{36 + 72 + 0}{\sqrt{6^2 + 12^2} \sqrt{6^2 + 6^2 + 10^2}}$$

RELATIVE MOTION

Velocity of A wrt ground = 10 m/s i

Velocity of B wrt ground = 6 m/s i

$$\boxed{\text{Velocity of A wrt B} = \vec{v}_{A/B} = \vec{v}_A - \vec{v}_B}$$

Velocity of A wrt B = $\vec{V}_{A/B}$ \equiv B की खोपड़ी पर बैठकर A को देख

$$\vec{v}_{A/B} = \vec{v}_A - \vec{v}_B$$

$$\vec{V}_{BA} = \vec{V}_B - \vec{V}_A$$

$$\text{Similarly } \vec{a}_{A/B} = \vec{a}_A - \vec{a}_B$$

$$\star \quad \textcircled{A} \rightarrow 6\text{m/s} \quad \textcircled{B} \rightarrow 8\text{m/s}$$

$$\vec{v}_{B/A} = 8\hat{i} - 6\hat{i} = 2\hat{i}$$

$$\vec{v}_{A/B} = 6\hat{i} - 8\hat{i} = -2\hat{i}$$

★ $\leftarrow 10\text{m/s}$ $\rightarrow 6\text{m/s}$

$$\vec{v}_{B/A} = \vec{v}_B - \vec{v}_A = (-10\hat{i} - (6\hat{i})) = -16\hat{i}$$

★ $\textcircled{A} \rightarrow 10\text{m/s}$ $\textcircled{B} \rightarrow 10\text{m/s}$

$$\vec{V}_{B/A} = 10 - 10 = 0$$

★ $\textcircled{A} \rightarrow 10\text{m/s}$ $\textcircled{B} \uparrow 20\text{m/s}$

$$\vec{v}_{B/A} = 20\hat{j} - 10\hat{i}$$

★

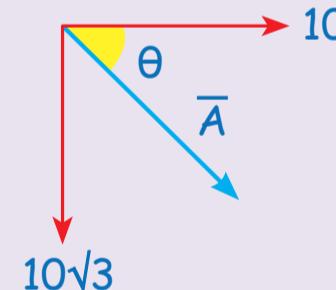

$$\begin{aligned} \vec{V}_{A/B} &= \vec{V}_A - \vec{V}_B \\ \vec{V}_{B/A} &= \vec{V}_B - \vec{V}_A \\ \vec{V}_{A/B} &= -\vec{V}_{B/A} \end{aligned}$$

अब आगे हमें relative motion, rain man, river boat problems पढ़ने हैं उसके लिए बहुत जरूरी है कि हम vector को draw करना सीखें इसके लिए i am attaching few fundamental things grab it.

★ $\vec{A} = 10\hat{i} - 10\sqrt{3}\hat{j}$

$$\tan \theta = \frac{10\sqrt{3}}{10}$$

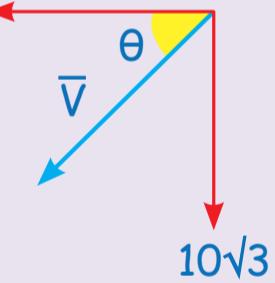

$$\theta = 60^\circ$$

★ $\vec{v} = -10\hat{i} - 10\sqrt{3}\hat{j}$

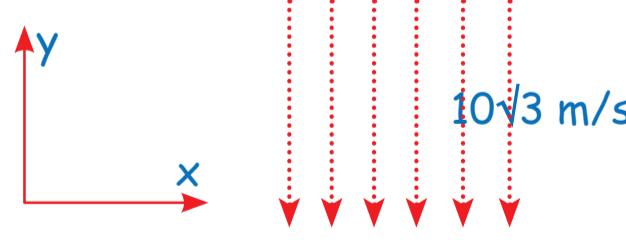

$$\tan \theta = \frac{10\sqrt{3}}{10}$$

$$\theta = 60^\circ$$

Q. A man is moving along +x-axis (east) with speed 10 m/s & rain is falling vertically downward with speed $10\sqrt{3}$ m/s. In which direction man should hold umbrella to protect himself.

Sol.

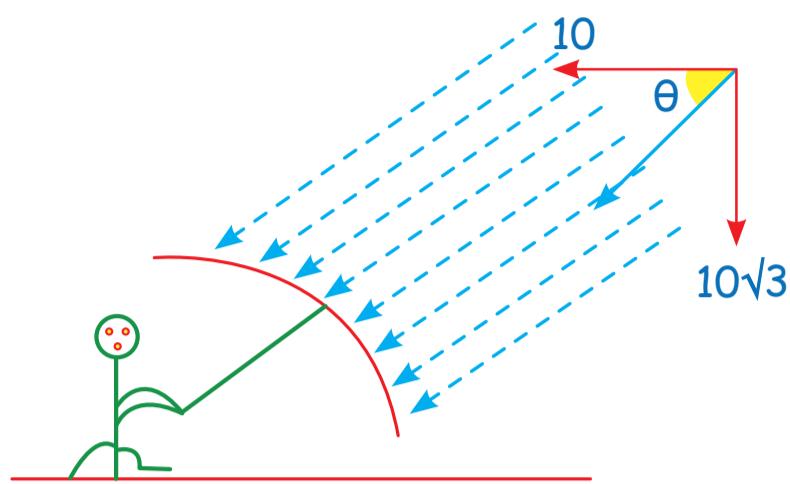

$$\vec{v}_{\text{man}} = 10\hat{i}$$

$$\vec{v}_{\text{rain}} = -10\sqrt{3}\hat{j}$$

$$\vec{v}_{\text{rain/man}} = \vec{v}_r - \vec{v}_m$$

$$\vec{v}_{r/m} = -10\sqrt{3}\hat{j} - 10\hat{i} = -10\hat{i} - 10\sqrt{3}\hat{j}$$

Q. A man is moving in east direction with speed 10 m/s in a car A bird is flying with speed $10\sqrt{3}$ in south direction

(1) Find velocity of bird observed by man

$$\vec{v}_{\text{man}} = 10\hat{i}$$

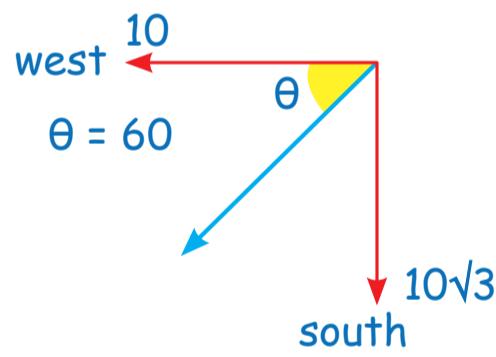

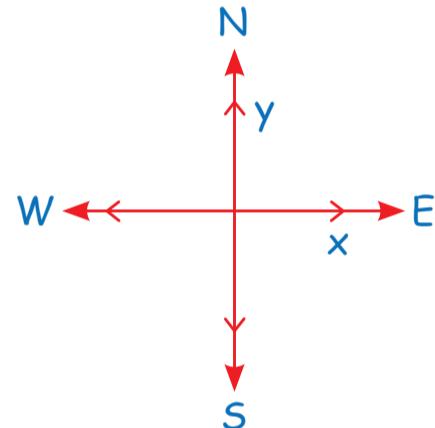

$$\vec{v}_{\text{bird}} = -10\sqrt{3}\hat{j}$$

$$\vec{v}_{b/m} = \vec{v}_b - \vec{v}_m$$

$$= -10\sqrt{3}\hat{j} - 10\hat{i}$$

$$|v_{b/m}| = \sqrt{10^2 + (10\sqrt{3})^2}$$

$$= 20 \text{ (} 60^\circ \text{ south of west)}$$

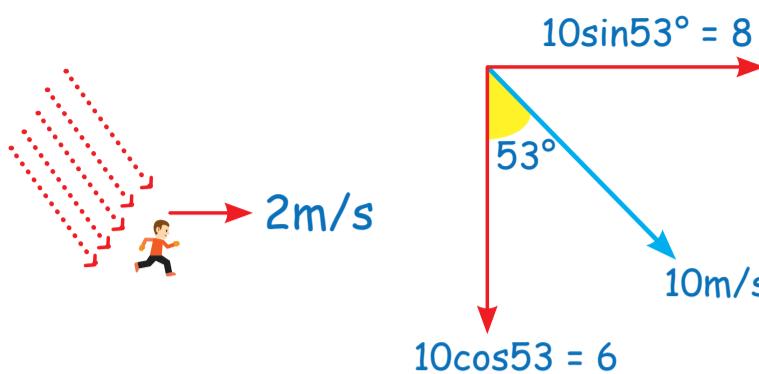

SKC

Rainman prob. जैसे ques के लिए ये 4 step follow करो

1. सबसे पहले velocity of man and rain निकालो
2. अब vectorly velocity of rain wrt man $\vec{v}_{r/m}$ निकालो
3. अब $\vec{v}_{r/m}$ को draw करके नया fig. बनाओ
4. अब हमें पता चल गया कि man को rain कहाँ आती दिख रही है so अब छाता लगा दो

Q. Rain is falling with speed 10 m/s at an angle 53° with vertical. A man is moving with speed 2 m/s along east as shown in diagram.

(1) In which direction man should hold umbrella to protect himself

$$\vec{v}_r = 8\hat{i} - 6\hat{j}$$

$$\vec{v}_m = 2\hat{i}$$

$$\vec{v}_{r/m} = (8\hat{i} - 6\hat{j}) - (2\hat{i})$$

$$= 6\hat{i} - 6\hat{j}$$

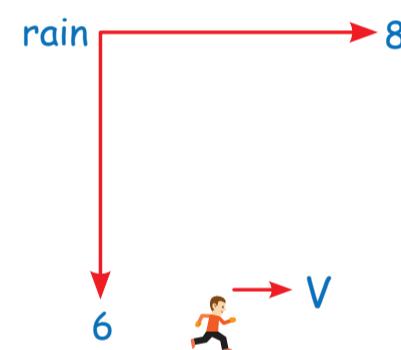

$$\tan \theta = \frac{6}{6}$$

$$\tan \theta = 1$$

$$\tan 45 = 1$$

$$\theta = 45^\circ$$

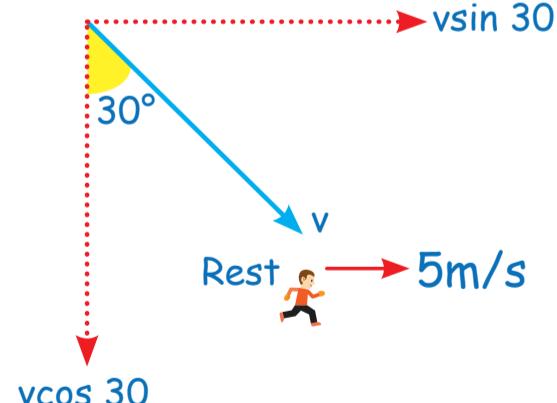

(2) What should be velocity of man so that rain appear falling vertically downward to him?

$$V = 8 \text{ Ans.}$$

Q. To a stationary man, rain appear to be falling at an angle 30° with the vertical As he start moving with speed of 5 m/s he feels that rain is falling vertically. Find speed of rain.

Sol.

$$v \sin 30 = 5$$

$$v = 10 \text{ speed of rain}$$

Q. A man holding a flag is running with speed 10 m/s along east. If wind speed is $10\sqrt{3}$ m/s along south then. In which direction flag will flutter?

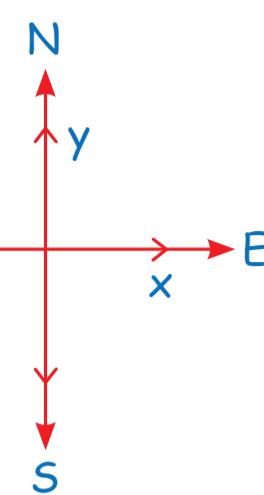

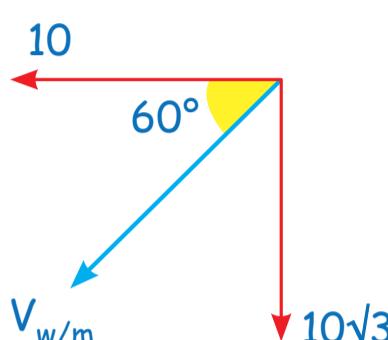

Sol. $\vec{V}_{\text{man}} = 10\hat{i}$

$\vec{V}_{\text{wind}} = -10\sqrt{3}\hat{j}$

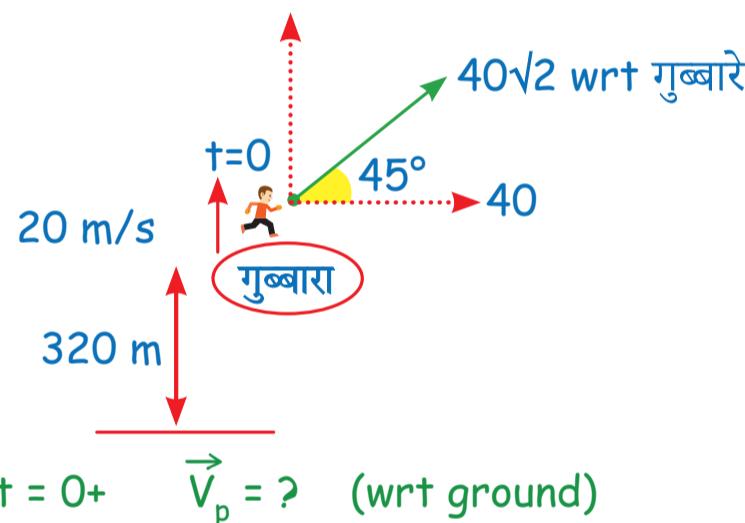

$\vec{V}_{w/m} = -10\sqrt{3}\hat{j} - 10\hat{i}$

Ans = 60° south of west

30° west of south

- Q. A balloon is rising upward with constant velocity 20 m/s . When it is at a height 320 m from ground a particle is projected from balloon with velocity $40\sqrt{2} \text{ m/s}$ at an angle of 45° with horizontal at $t = 0$.
Find velocity of particle just after projection and time of flight of particle.

Sol. $\vec{V}_{p/\text{balloon}} = 40\hat{i} + 40\hat{j}$

$\vec{V}_p - \vec{V}_{\text{balloon}} = 40\hat{i} + 40\hat{j}$

$\vec{V}_p - 20\hat{j} = 40\hat{i} + 40\hat{j}$

$\vec{V}_p = 40\hat{i} + 60\hat{j}$

$S = ut + \frac{1}{2}at^2$ (upward +ve)

$-320 = 60t - \frac{1}{2} \times 10 \times t^2$

Sol. e and get $t = 16 \text{ sec}$

अब ये तो अब 320 m के tower से पथर फेकने वाला ques. बन गया।

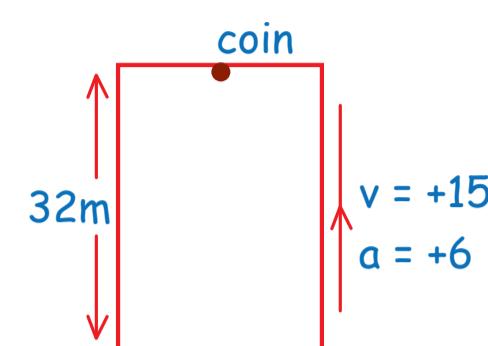

SKC

Q. stion में जब कभी भी lift का, गुब्बारे का acc given होता है, तो वो g को consider करने के बाद given होता है

66

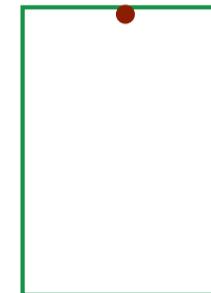

- Q. A lift of height 32 m is going up with constant acc $a = 6 \text{ m/s}^2$. When velocity of lift is 15 m/s upward, a coin is drop from ceiling of lift at $t = 0$. Find time when coin will hit the floor.

Sol. चुपचाप lift ke अंदर जाके बैठ जाओ.

wrt lift

$t=0^+$

(In lift frame or wrt lift)

At $t = 0$ $\vec{V}_{\text{coin/lift}} = 0$

$\vec{a}_{\text{coin/lift}} = -10 - (+6) = -16$

$\vec{s}_{\text{coin/lift}} = -32$

$S = ut + \frac{1}{2}at^2$

$-32 = 0 - \frac{1}{2} \times 16 \times t^2$

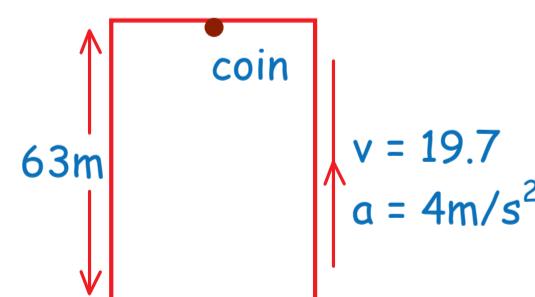

$t = 2 \text{ sec}$

SKC

ऐसे सवालों में सबसे पहले चुप चाप lift के अंदर जाके बैठ जाओ और coin की velocity, coin का acc lift के respect में लिखकर eqn of motion लगादो. बस ये याद रखना अगर coin हवा में है तो ground के respect में उसका acc नीचे g होगा

- Q. At $t = 0$ coin drop. Find time when coin will hit the floor

Sol. $\vec{u}_{\text{coin/lift}} = 0$

$\vec{a}_{\text{coin/lift}} = -10 - (+4) = -14$

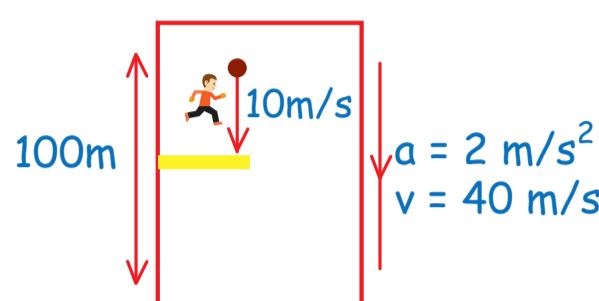

$$\vec{s}_{\text{coin/lift}} = -63 \text{ m}$$

$$s = ut + 1/2 at^2$$

$$-63 = 0 + 1/2 \times (-14) t^2$$

$$t = 3 \text{ sec}$$

Q. Ball thrown downward at 10m/s w.r.t lift.

When will coin strike the floor?

Sol. Lift ke अंदर आकर wrt lift.

$$v_{\text{coin/lift}} = -10$$

$$a_{\text{coin/lift}} = -10 - (-2) = -8$$

$$S_{\text{coin/lift}} = -100$$

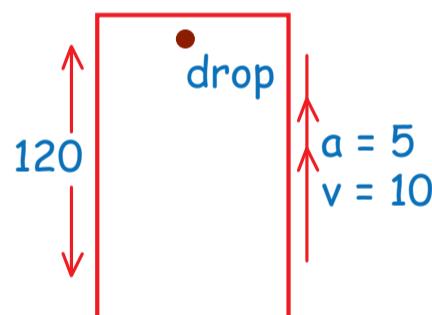

$$-100 = -10t + 1/2 (-8) \times t^2$$

$$100 = 10t + 4t^2$$

$$2t^2 + 5t - 50 = 0$$

$$t = 4$$

Q. When will coin strike the floor of lift.

Sol. $\vec{V}_{\text{coin/lift}} = 0$

$$\vec{a}_{\text{coin/lift}} = -10 - (+5) = -15$$

$$\vec{S}_{\text{coin/lift}} = -120$$

$$-120 = 0 + 1/2 (-15)t^2$$

$$t = 4 \text{ sec}$$

$$\text{lift } t = 4, S = ?, u = 10, a = 5$$

$$s = 10 \times 4 + 1/2 \times 5 \times 4^2 = 80$$

Find displacement of lift w.r.t ground before coin strike the floor?

Displacement of coin in t = 4 sec in ground frame

$$S = ut + 1/2 at^2$$

$$s = 10 \times 4 + 1/2(-10) \times 4^2$$

$$= 40 - 80 = -40 \text{ Ans}$$

Q. Car A and car B start moving simultaneously in the same direction along the line joining them. Car A moves with a constant acceleration $a = 4 \text{ m/s}^2$, while car B moves with a constant velocity $v = 1 \text{ m/s}$. At time $t = 0$, car A is 10 m behind car B. Find the time when car A overtakes car B. How much time A take to overtake.

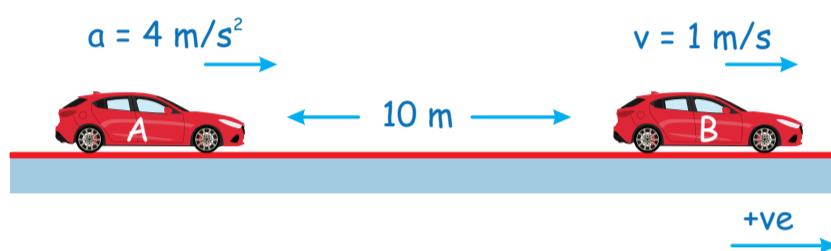

Sol. Given: $u_A = 0, u_B = 1 \text{ m/s}, a_A = 4 \text{ m/s}^2$ and $a_B = 0$

Assuming car B to be at rest, we have

$$u_{AB} = u_A - u_B = 0 - 1 = -1 \text{ m/s}$$

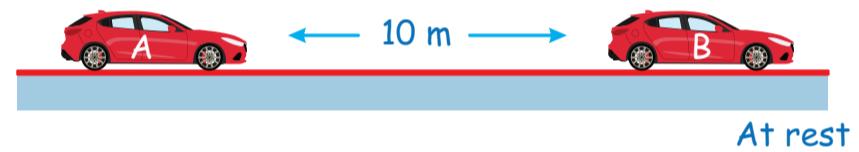

$$a_{AB} = a_A - a_B = 4 - 0 = 4 \text{ m/s}^2$$

Now, the problem can be assumed in simplified form as follow:

Substituting the proper values in equation

$$u_{AB} = -1 \text{ m/s}, a_{AB} = 4 \text{ m/s}^2$$

$$S = ut + \frac{1}{2} at^2$$

$$\text{we get } 10 = -t + \frac{1}{2}(4)(t^2) \text{ or } 2t^2 - t - 10 = 0$$

Ignoring the negative value, the desired time is 2.5s.

Note: The above problem can also be solved without using the concept of relative motion as under. At the time when A overtakes B,

$$S_A = S_B + 10$$

$$\therefore \frac{1}{2} \times 4 \times t^2 = 1 \times t + 10$$

$$\text{or } 2t^2 - t - 10 = 0$$

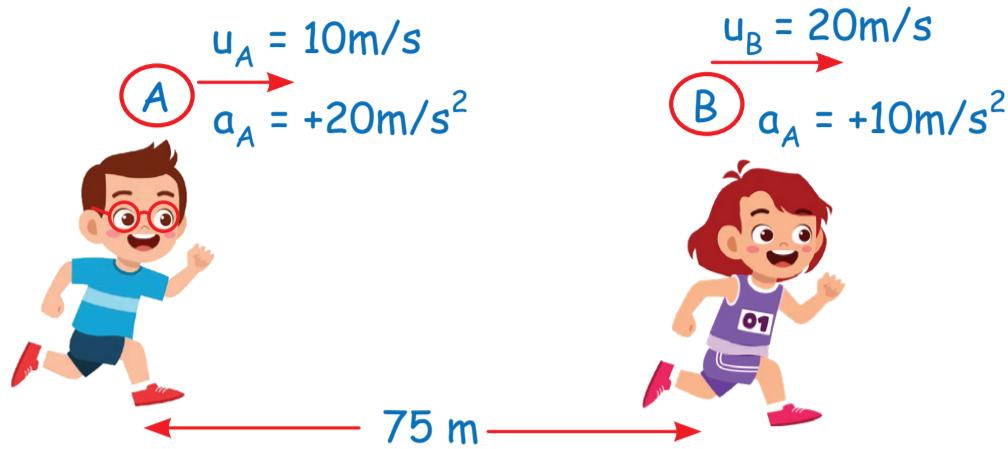

Which on solving gives $t = 2.5 \text{ s}$ and -2 s , the same as we found above.

SKC

Catching बाले सवालो मे

- ♦ सबसे पहले आगे वाले बंदे पर बैठ जाओ
- ♦ बाद आगे वाले के respect में intial v, a, s लिखो
- ♦ equatⁿ of motion ठोक दो

Q. At $t = 0$ gap between saleemian boy A and girl B is 75 m. Find when boy will catch the girl.

Sol. M-1 (relative वाला method, आगे वाले के ऊपर जाके बैठ जाओ)

$$\vec{u}_{A/B} = 10 - 20 = -10$$

$$\vec{a}_{A/B} = 20 - 10 = 10$$

$$s = ut + 1/2 at^2$$

$$75 = -10t + (1/2)10 t^2$$

$$5t^2 - 10t - 75 = 0$$

Sol. e and get $t = 5$

M-2

$$75 + x_b = x_a$$

$$75 + 20t + 1/2 \times 10 \times t^2 = 10t + 1/2 \times 20 \times t^2$$

$$75 + 20t + 5t^2 = 10t + 10t^2$$

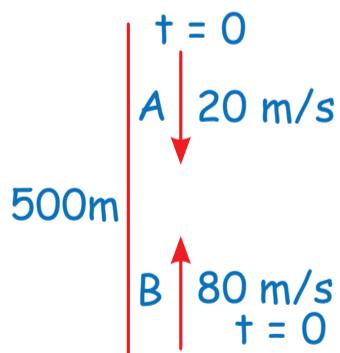

$$5t^2 - 10t - 75 = 0$$

$$t^2 - 2t - 15 = 0$$

$$(t - 5)(t + 3) = 0$$

$$t = 5$$

Q. A & B are thrown as shown simultaneously at $t = 0$ when will they meet?

$$\vec{v}_{A/B} = -20 - 80 = -100$$

$$\vec{a}_{A/B} = -10 - (-10) = 0$$

$$s_{A/B} = -500$$

$$-500 = -100t + 1/2 \times 0 \times t^2$$

$$t = 5 \text{ sec}$$

Directⁿ

$$\vec{a}_{rel} = 0$$

$$\vec{v}_{rel} = 100$$

$$500 = 100t$$

$$t = 5 \text{ sec}$$

RIVER-BOAT-MAN PROBLEM

भाई ये JEE-Mains और NEET का favourite article है बेशरमों की तरह बार-बार आता रहता है इसे अच्छे से कर लेना

Q. River is flowing with speed 6 m/s, and $\vec{v}_{man/river}$ is 10 m/s.

Man start swimming from A to B and return back to A. Find time taken

$$(A \rightarrow B) t_{A \rightarrow B} = \frac{48}{10 + 6} = 3 \text{ sec}$$

$$(B \rightarrow A) t_{B \rightarrow A} = \frac{48}{10 - 6} = 12 \text{ sec}$$

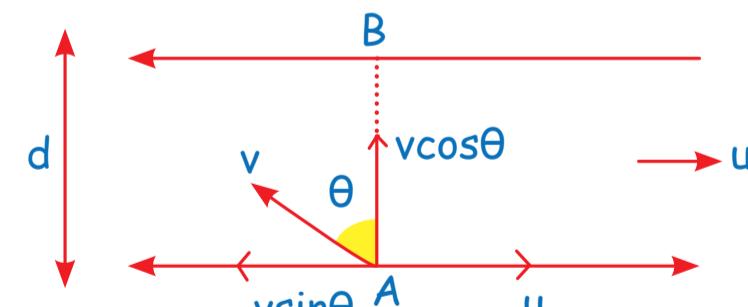

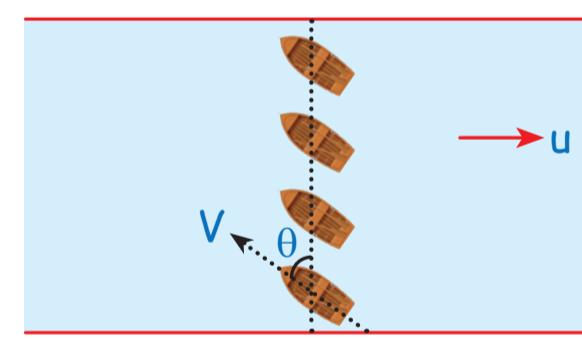

$$\text{total time} = 3 + 12 = 15 \text{ sec}$$

$$\text{Average speed} = \frac{48 + 48}{15}$$

$$\text{Avrg velocity} = 0$$

Case-I

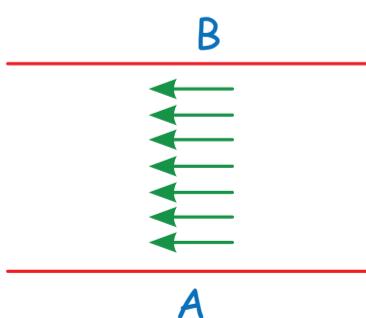

Crossing of river in min distance.

Drift = 0

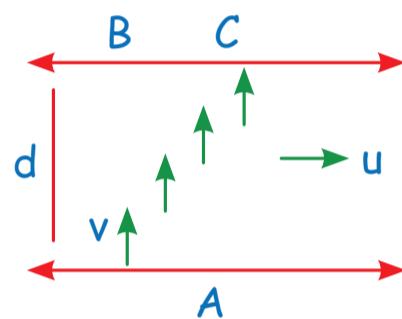

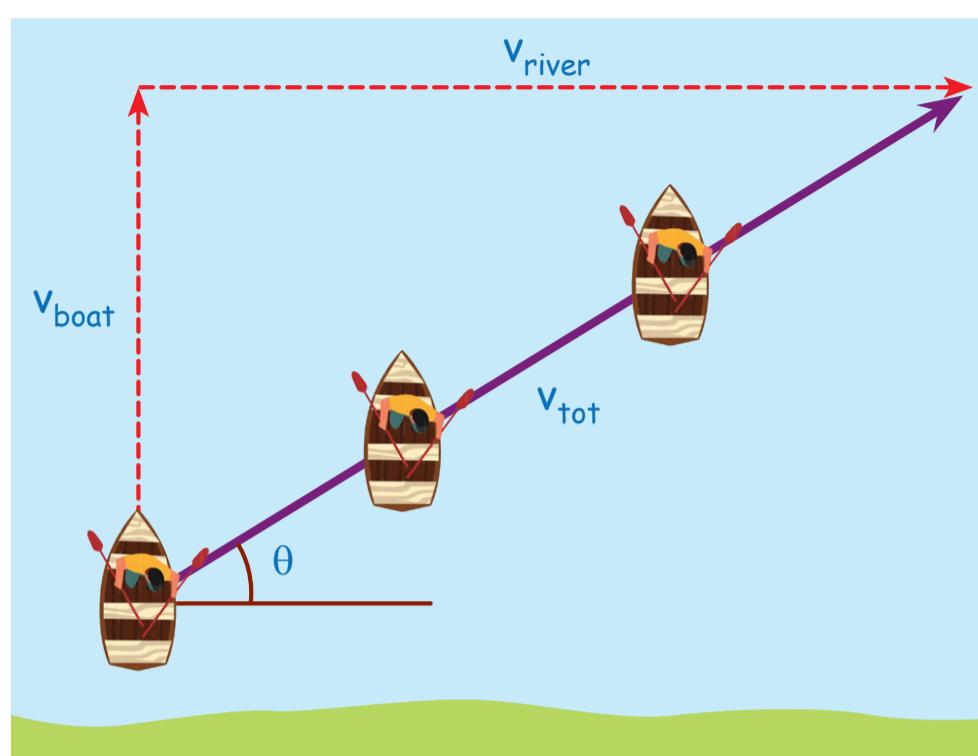

$$V \sin \theta = u$$

$$t = \frac{d}{u \cos \theta}$$

Case-II

Crossing of river in min time

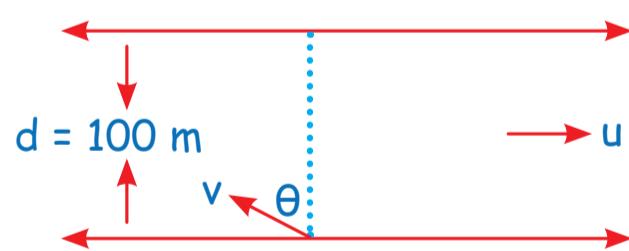

$$\text{Min time} = d/v$$

$$\text{Drift} = CB = ut$$

Q. A river is flowing with velocity 5 m/s wrt ground. A man can swim with velocity 10 m/s wrt river. The width of the river is 100 m.

(1) In which direction man should swim so that he crosses that river in min distance travel also find time taken to cross the river.

$$\vec{v}_{m/r} = v = 10 \text{ m/s}$$

$$u = 5 \quad d = 100$$

$$v \sin \theta = u$$

$$10 \sin \theta = 5$$

$$\sin \theta = 1/2$$

$$\sin \theta = 30^\circ$$

$$\text{time} = \frac{d}{v \cos \theta} = \frac{100}{10 \cos 30^\circ}$$

(2) If he want to cross the river in min possible time find min time to cross the river & drift

$$\text{Sol. } t = \frac{100}{10} = 10 \text{ sec}$$

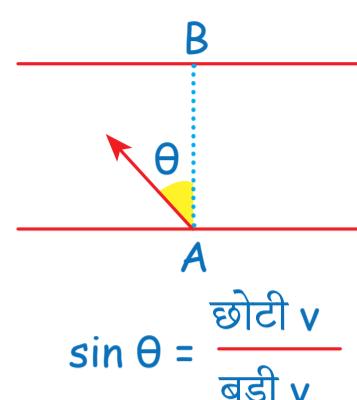

$$BC = \text{drift} = 5 \times 10 = 50 \text{ m}$$

$$\text{Q. } u = 10\sqrt{3}, \vec{V}_{m/r} = 20$$

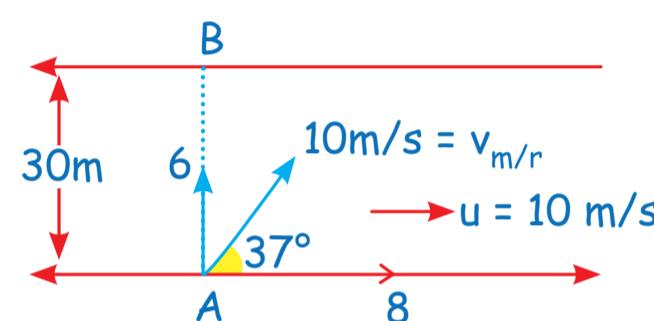

$\theta = ?$ for min distance

$$\text{Sol. } \sin \theta = \frac{10\sqrt{3}}{20} = \frac{\sqrt{3}}{2}$$

$$\theta = 60^\circ$$

Q. In following figure if man is swimming with velocity 10 m/s wrt river at an angle of 37° to the river velocity. Find time taken to cross the river and drift if velocity of river is 10 m/s and width of the river is 30 m/s

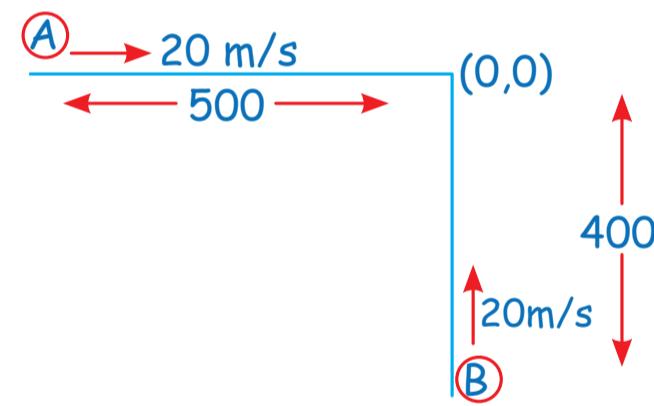

$$\text{Sol. } t = \frac{30}{6} = 5 \text{ sec}$$

Find drift

$$BC = 18 \times 5 = 90 \quad [V_{net} = 10 + 8 = 18]$$

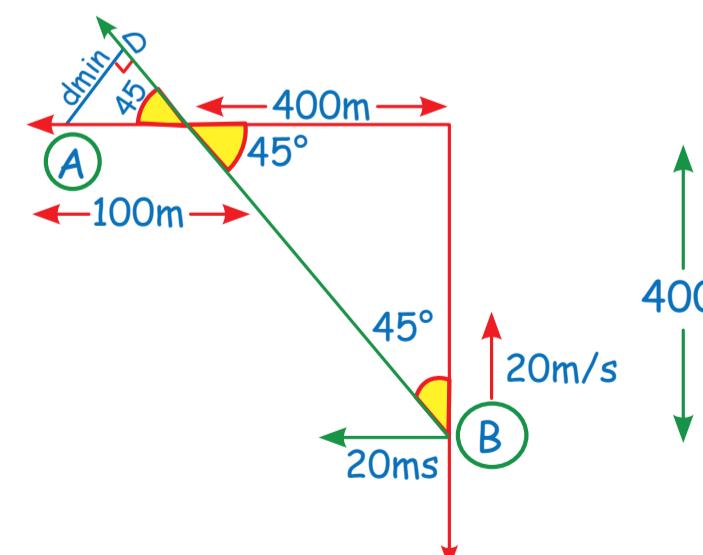

Q. Min distance between the moving particle.

$$\vec{V}_A = -20\hat{i}$$

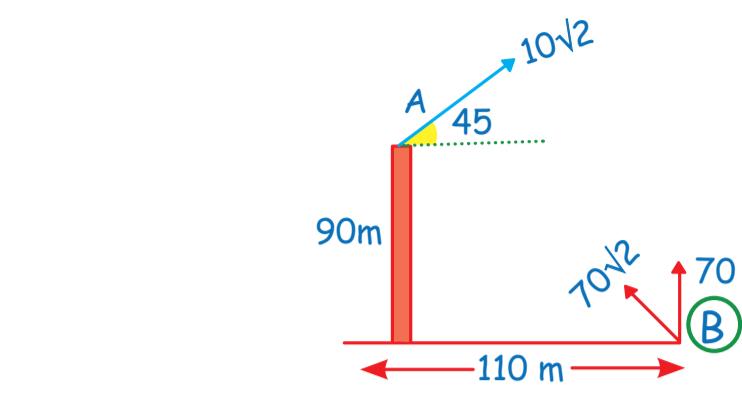

$$\vec{V}_B = 20\hat{j}$$

$$\vec{V}_{B/A} = -20\hat{i} + 20\hat{j}$$

$$AD = d_{min} = 100 \sin 45^\circ$$

Q. Min Distance between them

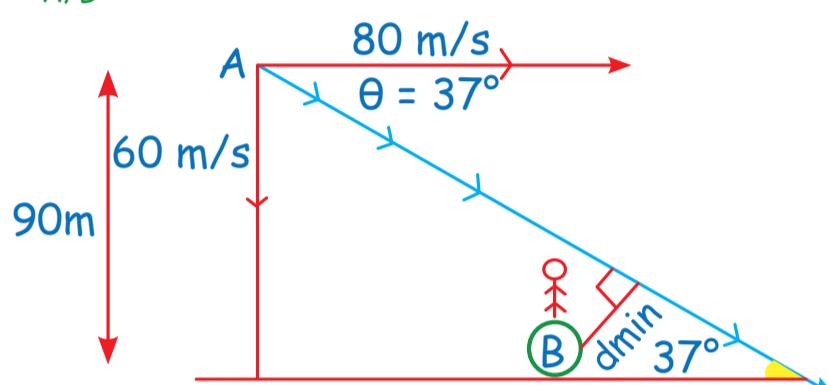

$$\text{Sol. } \vec{V}_A = 10\hat{i} + 10\hat{j}$$

$$\vec{V}_B = -70\hat{i} + 70\hat{j}$$

$$\vec{V}_{A/B} = 80\hat{i} - 60\hat{j}$$

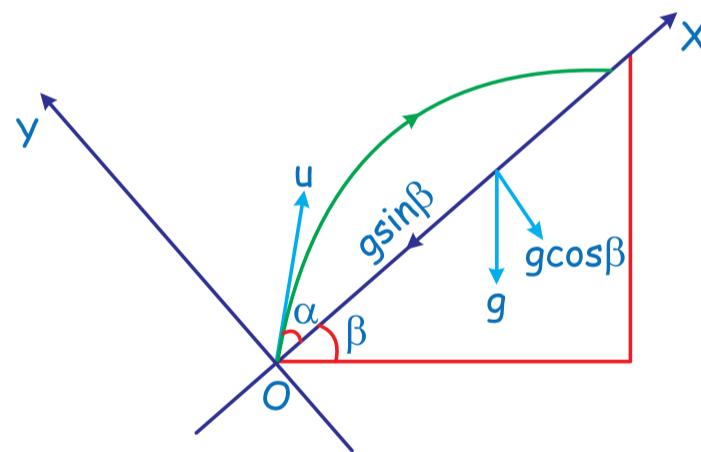

$$\vec{a}_{A/B} = 0$$

PROJECTION ON AN INCLINED PLANE

Case-I: Particle is projected up the incline

Here α is angle of projection w.r.t. the inclined plane.

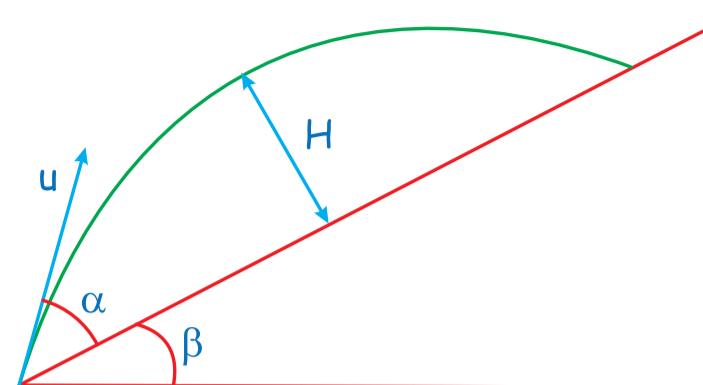

$$a_x = -g \sin \beta, \quad u_x = u \cos \alpha \\ a_y = -g \cos \beta, \quad u_y = u \sin \alpha$$

Time of flight (T): When the particle strikes the inclined plane, y becomes zero

$$y = u_y t + \frac{1}{2} a_y t^2 \\ \Rightarrow 0 = u \sin \alpha t - \frac{1}{2} g \cos \beta t^2 \\ \Rightarrow T = \frac{2u \sin \alpha}{g \cos \beta} = \frac{2u_y}{g_y}$$

where u_{\perp} and g_{\perp} are component of u and g perpendicular to the incline.

Maximum Distance from Inclined Plane (H):

When half of the time is elapsed y -coordinate is equal to maximum distance from the inclined plane of the projectile

$$H = u \sin \alpha \left(\frac{u \sin \alpha}{g \cos \beta} \right) - \frac{1}{2} g \cos \beta \left(\frac{u \sin \alpha}{g \cos \beta} \right)^2$$

$$\Rightarrow H = \frac{u^2 \sin^2 \alpha}{2g \cos \beta} = \frac{u_y^2}{2g_y}$$

Range Along the Inclined Plane (R):

When the particle strikes the inclined plane, x coordinate is equal to range of the particle

$$x = u_x t + \frac{1}{2} a_x t^2$$

$$\Rightarrow R = u \cos \alpha \left(\frac{2u \sin \alpha}{g \cos \beta} \right) - \frac{1}{2} g \sin \beta \left(\frac{2u \sin \alpha}{g \cos \beta} \right)^2$$

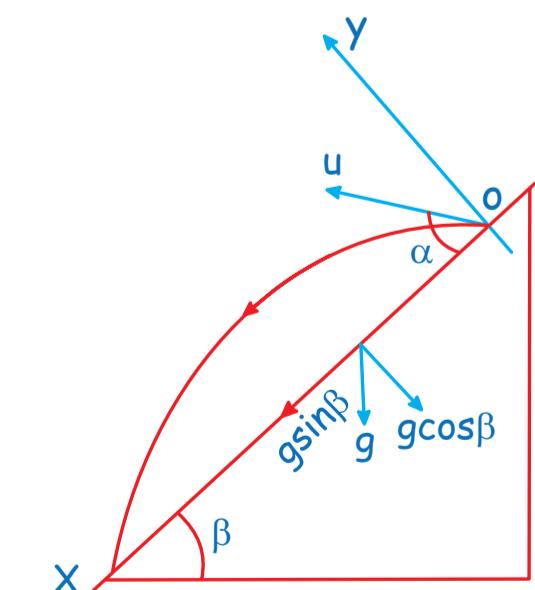

$$\Rightarrow R = \frac{2u^2 \sin \alpha \cos(\alpha + \beta)}{g \cos^2 \beta} \quad (\text{इसको रटना मत बस ये देखो})$$

eqn मे value कैसे put कर रहे हैं?

In this case after solving we got range will be maximum

$$\text{when } \alpha = \frac{\pi}{4} - \frac{\beta}{2} \text{ and Max. Range} = \frac{u^2}{g[1 + \sin \beta]}$$

Case-II: Particle is projected down the incline

$$a_x = g \sin \beta, \quad u_x = u \cos \alpha \\ a_y = -g \cos \beta, \quad u_y = u \sin \alpha$$

Time of Flight (T):

When the particle strikes the inclined plane y coordinate becomes zero

$$y = u_y t + \frac{1}{2} a_y t^2 \Rightarrow 0 = u \sin \alpha T - \frac{1}{2} g \cos \beta T^2$$

$$\Rightarrow T = \frac{2u \sin \alpha}{g \cos \beta} = \frac{2u_y}{g_y}$$

Maximum Distance (H):

When half of the time is elapsed y coordinate is equal to maximum distance of the projectile from the plane.

$$H = u \sin \alpha \left(\frac{u \sin \alpha}{g \cos \beta} \right) - \frac{1}{2} g \cos \beta \left(\frac{u \sin \alpha}{g \cos \beta} \right)^2$$

$$H = \frac{u^2 \sin^2 \alpha}{2g \cos \beta} = \frac{u_y^2}{2g_y}$$

Range Along the Inclined Plane (R):

When the particle strikes the inclined plane x coordinate is equal to range of the particle

$$x = u_x t + \frac{1}{2} a_x t^2$$

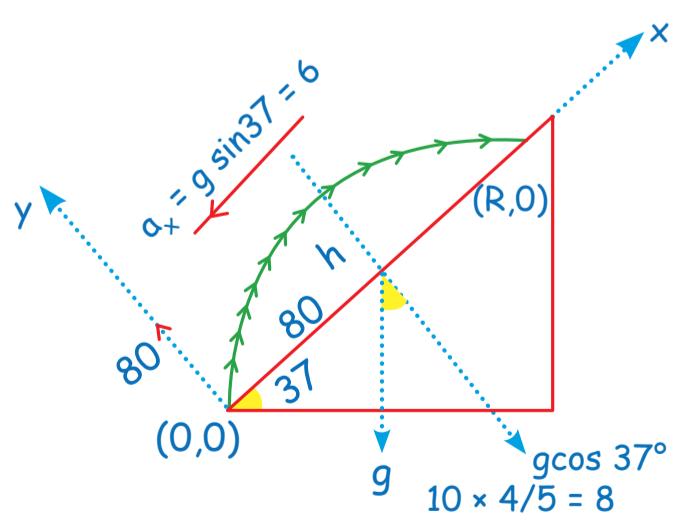

$$\Rightarrow R = u \cos \alpha \left(\frac{2u \sin \alpha}{g \cos \beta} \right) + \frac{1}{2} g \sin \beta \left(\frac{2u \sin \alpha}{g \cos \beta} \right)^2$$

$$R = \frac{2u^2 \sin \alpha \cos(\alpha - \beta)}{g \cos^2 \beta}$$

In this case after solving we got range will be maximum

$$\text{when } \alpha = \frac{\pi}{4} + \frac{\beta}{2} \text{ and Max. Range} = \frac{u^2}{g[1 - \sin \beta]}$$

Q. A particle is projected with velocity $80\sqrt{2}$ at an angle 45° with inclined plane. If inclined plane makes angle 37° with horizontal. Time of flight and range of particle.

$$\text{Time of flight} = T = 10 + 10 = 20 \text{ sec}$$

$$\text{Sol. } T = \frac{2u_y}{a_y} = \frac{2 \times 80}{8} = 20 \text{ sec}$$

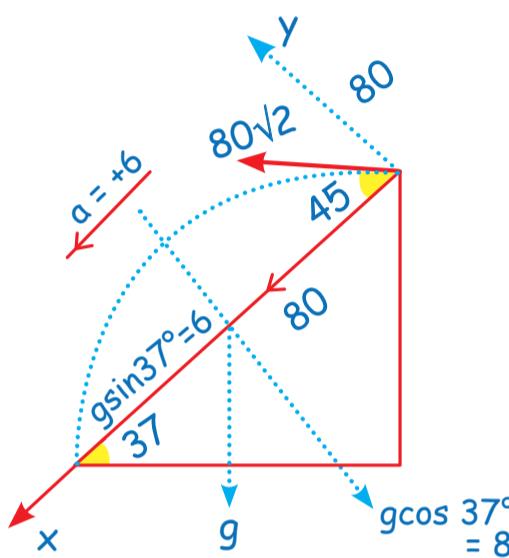

$$R = ut + \frac{1}{2} at^2 \quad (\text{x mai})$$

$$R = 80 \times 20 - \frac{1}{2} g^2 \times (20)^2$$

$$= 1600 - (3 \times 400)$$

$$1600 - 1200 = 400 \text{ m}$$

Q. Repeat the above ques. for following fig.

$$\text{Sol. } T = \frac{2 \times 80}{8} = 20$$

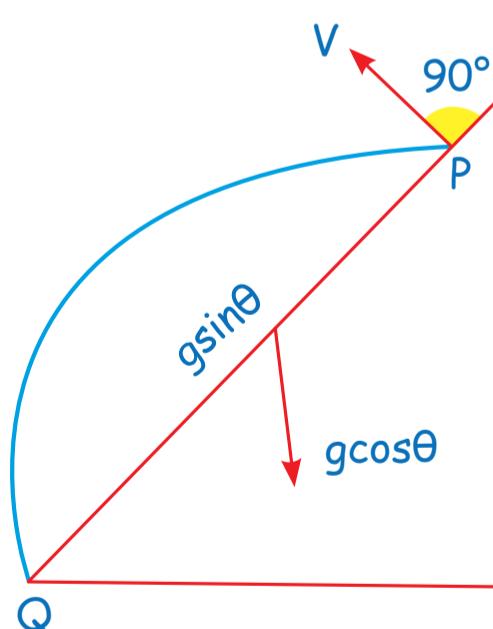

$$\text{Range} = 80 \times 20 + 1/2 \times 6 \times 20^2$$

$$= 1600 + 3 \times 400$$

$$= 1600 + 1200$$

$$= 2800$$

Q. Time of flight is T find PQ

$$\text{Sol. } PQ = 1/2 g \sin \theta T^2$$

$$= \frac{1}{2} g \sin \theta T \times \frac{2V}{g \cos \theta} \quad \left[T = \frac{2V}{g \cos \theta} \right]$$

$$TV \tan \theta$$
